**Sarnia, Ont.**—It is understood that as a result of the recent inspection of the city's fire fighting apparatus and water system by the underwriters' inspector, Norman R. Wilson, C.E., a recommendation will be sent to the city council next month that a new fire alarm system be installed all over the city, and that another fire station be erected in the south ward, and that a combination chemical tank and hose truck, motor-driven, be installed in the main station on George Street.

**General Industrial**

**Hamilton, Ont.**—The American Can Co. will probably extend their factory here.

**Montreal, Que.**—The Dominion Cutlery Co., 591 St. Catherine street west, are considering the erection of a factory.

**Ingersoll, Ont.**—Important orders from Russia for agricultural implements have been received by the Noxon Company.

**Vancouver, B.C.**—The Great North-Western Salmon Cannery and a wharf were burned at West Vancouver. Loss \$20,000.

**Winnipeg, Man.**—Fire on November 17 destroyed the Borbridge Co. harness factory on Ross Avenue. The loss is estimated at \$100,000.

**Toronto, Ont.**—The Imperial Varnish Co. premises at 8 Morris Street were badly damaged by fire which broke out late Saturday night. The damage is estimated at \$3,000 to the contents and \$500 to the building.

**Toronto, Ont.**—Fire, entailing a loss of about \$100,000, broke out on Nov. 15 in the section of the Adams Bros.' factory, at the corner of King and Frederick streets, which was devoted to the manufacture of saddlery and harness. The loss is fully covered by insurance.

**Smith's Falls, Ont.**—On Nov. 9 fire destroyed the plant of the Canadian Cooperage Mfg. Co. The main buildings were burned and all the machinery was ruined. The fire is supposed to have started in the boiler house, and the loss is estimated at from \$10,000 to \$12,000, which is partly covered by insurance. It is expected the plant will be rebuilt at once.

**Tenders**

**Winnipeg, Man.**—Tenders addressed to the undersigned will be received up to December 18, for the construction of 9½ miles of 5 ft. 6 in. reinforced concrete pipe. Plans, specifications and form of tender can be secured on application to the district, accompanied by certified cheque for \$20. R. D. Waugh, chairman of Winnipeg Water District Commissioners, 901 Boyd Building, Winnipeg.

**Electrical**

**Quebec, Que.**—The electric plant of the town of Megantic was entirely wiped out by fire on Nov. 9.

**Toronto, Ont.**—The Toronto Hydro-Electric Commission propose building an extension to the sub-station on Duncan street. The cost is estimated at \$90,000.

**Aylmer, Ont.**—A by-law to authorize the construction of a Hydro radial line via Aylmer and Tillsonburg to Port Burwell will be submitted in January to the ratepayers of Westminster Township, South Dorchester Township and Dereham.

**Sarnia, Ont.**—Hydro power will be first used here at the plant of the Central Stone Co. of Canada, which is now being erected at Point Edward. This company is ready for operation and will start work on the stone for the Central Station, Toronto.

**Kingston, Ont.**—The Hydro-Electric Commission, through its engineer, Gordon Kribs, has made a new power proposition to the Kingston Utilities Commission. The new offer is to supply 1,000 h.p. at \$29 per h.p. When the consumption is increased to 1,125 h.p., the commission will be able to get it for \$28 per h.p. This makes the third offer from the Hydro Commission.

**Railways—Bridges**

**Watford, Ont.**—The G. T. R. overhead bridge here, which was a wooden structure, is being removed by the company and preparations being made for a new steel structure.

**Toronto, Ont.**—It is proposed that authority be given the Harbor Commissioners to proceed with the erection of a new bascule bridge at the foot of Cherry Street to provide access to the industrial area in Ashbridge's marsh district. This has already received the sanction of the council, but owing to the delay in awarding tenders for the work and other causes, the cost originally estimated at \$101,200 has been increased to \$149,000.

The officials report that the cost is likely to be further increased if advantage is not taken of the prices now quoted by contractors.

## New Incorporations

**The Sterling Engine Works**, of Winnipeg, have been incorporated with a capital of \$25,000 by R. M. Wolvin, G. Coulter, and F. Milan.

**The New Westminster Foundry Co.**, of New Westminster, B.C., has been incorporated to carry on a general business of iron foundry, boilermakers, etc.

**The Foundry Products, Ltd.**, of Calgary, has been incorporated with a capital stock of \$500,000 by Daniel L. Redman, Charles W. Coole, Peter D. McAlpine and others.

**The Universal Smokeless Heat Generator Co.**, Victoria, B.C., has been incorporated for \$50,000. It will acquire patents held by its stockholders for improvements in heat-generating processes and furnaces.

**The Reid Products Co.** has been incorporated at Toronto, with a capital of \$40,000, to manufacture incinerators, etc., at Toronto. Incorporators are: L. A. Reeves, R. H. Reeves, and A. C. F. West, all of Toronto.

**The Beaver Board Timber Co.** has been incorporated at Ottawa, with a capital of \$100,000, to manufacture pulp and pulp products, the head office to be in Toronto. Incorporators are: J. B. O'Brien, M. C. vander Voort and A. T. Maher, all of Toronto.

**British Chemical Co.** has been incorporated at Ottawa, with a capital of \$50,000, to manufacture all kinds of explosives, chemicals and fertilizers, with head office at Montreal. The incorporators are: F. G. Bush, G. R. Drennan, and A. G. Yeoman, all of Montreal.

**The Sterling Engine Works, Ltd.**, of Winnipeg, has been incorporated with a capital stock of \$25,000 by Vincent C. Maddock, Roy M. Wolvin, William J. Leaney, and others, to manufacture steam and gasoline engines, boilers, agricultural implements, etc.

## Contracts Awarded

**Galt, Ont.**—The contract for the construction of two new buildings for the Galt Brass Co., has been awarded to P. H. Secord & Sons, of Brantford, Ont. Estimated cost, \$15,000.

**New Toronto, Ont.**—The general contract for the erection of a factory for the Dominion Abrasive Wheel Co., Ltd., has been let to the Toms Contracting Co., Toronto. Approximate cost, \$65,000.

Agents: The Canadian Fairbanks-Morse Co., Ltd., Montreal, St. John, Toronto, Winnipeg, Calgary, Vancouver, Ottawa, Quebec, Hamilton, Saskatoon and Victoria.

**London, Ont.**—Contracts for two new 72-foot steel motor coaches for the London & Port Stanley Railway, to be delivered in time for next season's excursion business, have been awarded by the London Railway Commission. The wheels were let to a Walkerville company, the electric motors and air brake apparatus to another Canadian company and the car bodies to the Jewett Car Co., of Newark, Ohio.

## Marine

**Victoria, B.C.**—An order for a steel stern-wheel vessel, similar to one now under construction, has been placed with the firm of Yarrows, Limited, of this city.

The American Star Steamship Corporation has, it is understood, purchased the Fordonian and Algonquin from Canadian owners. The Fordonian was built in Glasgow in 1912 and has a gross tonnage of 2,368 tons. The Algonquin, with a gross tonnage of 1,806 tons, was built in 1888.

**Ottawa, Ont.**—The business of building ships in Canada for Norwegian register is developing rapidly. An Order-in-Council has been passed authorizing the construction of two steel steamers in the Vancouver yards of J. Coughlan & Sons, on an order from Norwegian interests.

**Vancouver, B.C.**—S. Spratt, representing the Amalgamated Dry Dock & Engineering Co., which concern holds the Order-in-Council authorizing the issuance of bonds to the extent of five and a half million dollars for establishing a plant at Vancouver, have been here in connection with the big scheme.

**Third Oil Tanker Commissioned.**—On the morning of Nov. 19, the Sarnolite left Collingwood on her maiden trip to Montreal. She was launched September 27, and is the third oil tanker of this class turned out by the local shipyards this year for the Imperial Oil Co. She will be used this winter on Atlantic coast service.

**C.P.R. Buys Steamer.**—The C.P.R. is reported to have purchased the steamship Hackness from Pyman Bros., Ltd., of Wales. The Hackness was built in 1914 and is of the shelter deck type, 4,928 gross tons and 2,954 tons net register. She was formerly owned by the London & Northern Steamship Co., owning 16 vessels, with a combined carrying capacity of 93,000 tons, all of which have been acquired by Pyman, Watson & Co., South Wales, for about \$2,000,000. The Hackness has been under charter to the C.P.R. for several months, plying in the Atlantic service.

**Sarnia, Ont.**—The steamers Royalite and Iocolite, of the Imperial oil fleet, will leave in the near future for the Atlantic Ocean, where they will be engaged in the oil trade during the coming winter. It is expected that they will carry oil from Halifax to other points on the Atlantic, and will return to the lakes in the spring. They will take a cargo from here to Montreal on their last trip.

**Sarnia, Ont.**—The Reid Wrecking Co. has purchased the steamer Kongo from Cleveland parties and will transfer the steamer to Canadian register. It will be used for transportation of coal, or any other merchandize. The Kongo is a 252-foot boat and has a carrying capacity of from 900 to 1,000 tons. This boat makes the third addition to this company's fleet of steamers, the other two being the Spokane and the Wyoming.

The Canada Steamship Lines, Ltd., steamship Wahcoondah is reported to have been sold recently to British buyers at about \$46,000. This steamship, well known on the lakes and in Montreal, has a gross tonnage of 1,554, and she was built at Port Glasgow in 1903. The Grelford, known formerly under the names of Nancy Lee and Minterne, has been sold to Watkin, Williams & Co., Cardiff, for about £75,000, a tidy profit when one considers that Messrs. J. Gould & Co., Cardiff, bought the vessel in November last for \$44,000.

## Wood-Working

**Hamilton, Ont.**—The Parry Sound Basket & Veneer Co., which proposes to discontinue business in Parry Sound, may build a factory at Stoney Creek, near here.

## Personal

**Geo. D. MacDougall**, mechanical superintendent of the Dominion Steel Corporation, Sidney, N.S., has been promoted to the position of chief engineer.

## Trade Gossip

**Winnipeg, Man.**—The Ontario & Manitoba Cold Storage Co. proposes to build a cold storage plant to cost \$100,000.

The Canadian Ice Machine Co., Toronto, have been awarded a contract for a cold storage and ice plant for the General Hospital, Sault Ste. Marie, Ont.

**Kingston, Ont.**—The Canadian Locomotive Co. have received an order for twenty locomotives from the Russian Government. The price has not been divulged.

**Price of Oil Advances.**—Crude oil has been advanced five cents by the Imperial Oil Co., making the present price \$1.88 per barrel. This is only one of many advances in the price of crude oil recently.

**Toronto, Ont.**—The Pelsons Iron Works will build two steel freighters for Norwegian owners, in addition to two now under construction at their shipyards. Each of the new steamers will have a capacity of 4,250 tons.

**Toronto Ont.**—The Toronto Harbor Commission announces that numerous enquiries have been received for industrial sites in the Ashbridge's Bay factory district. Baines & Peekover, steel merchants, of Toronto, have leased a site for a warehouse to cost \$20,000.

**St. Catharines, Ont.**—Rumors that when work on the ship canal is shut down for the winter season it will remain in that condition until after the end of the war have been revived, and are given some credence by Chief Engineer Weller, who also intimates that the original estimate of the cost, \$50,000,000, would likely be exceeded because of existing conditions.

**Natural Gas Supply Fails.**—Complaints are being made in Sarnia and Ford, Ont., owing to the frequency which the natural gas supply has failed during the past few weeks. The fields near Tilbury are taxed to the utmost and the cold weather has made the situation worse. Many factories supplied from Tilbury are affected.

**Victoria, B.C.**—Steel shipbuilding on an important scale will be started in Victoria with the closing of a deal which is pending between local shipyards and a syndicate of Bergen and Christiania shipping interests, represented by John Meyer a prominent civil engineer of Christiania, who is looking into the local situation with a view to placing contracts for a number of steel freighters.

**Trade Commission Report.**—A commission headed by J. W. Woods, of Toronto, which last summer visited Great Britain, France, Italy and Belgium, studying ways and means of developing Canadian trade, has submitted a report to the Minister of Trade and Commerce, Ottawa. There are a number of recommendations, some of which are already in force, while the report itself will be made public shortly.

**Russia Has Closed Pacific Ports.**—The Department of Trade and Commerce, Ottawa, has been advised of the closing of the Russian Pacific ports. Licenses for importations via the port of Vladivostok will be granted by the

Steel Shell Forgings or Billets of any size or weight will move any distance or about curves upon our specially constructed Gravity Carriers and Incline or Horizontal power devices. No labor required.

Workmen.  
In Light and Air and sanitary Working Con-  
ditions.  
In clean, fresh drinking water for everybody.  
In the Safety, Economy and Man-betterment.*

### **PURO** SANITARY DRINKING FOUNTAIN

(MADE IN CANADA)

The loss of a man through impure drinking water is a crime that "the front office" must bear.

An ugly statement, isn't it? But true, absolutely.

When a man comes to work in your factory he puts his health in your keeping.

Are you willing to take chances on such a trust?

Impure drinking conditions are responsible for more tragedies than any machine ever built.

Apply the "Safety First" Principles to your water supply; don't deny your men a clean, fresh drink of water.

Conserve their health and they will improve your profits; make yourself as worthy of the name of "employer."

Install the Gold Medal winner Puro in your plant, office and shop alike.

The only Sanitary Drinking Fountain that is safe, sanitary, simple, automatic in control and easily attached.

Let us tell you just what it will cost you to

Russian Minister of Commerce in Petrograd. The reason of the Russian Government for taking this means of controlling the Pacific import trade is not stated, but it is possible that the purpose is to conserve transportation facilities as far as possible for shipments necessary in the conduct of the war.

**U. S. Bank at Petrograd.**—The National City Bank, it is learned, has obtained the necessary authority from the Russian Government to establish a branch bank in Petrograd. The branch is to be opened at once. When established it will be the second foreign bank in the Russian metropolis. The branch is to be under the management of H. F. Meserve, of the National City Bank forces, who has been in Petrograd several months superintending the details preliminary to the opening of the branch bank, and in anticipation of the receipt of the necessary permission.

**Canadian Gasoline Consumption.**—American consular reports say that the consumption of American gasoline in Canada during 1916 will be 25 to 30 per cent. greater than during 1915, when the total used was some 60,000,000 gallons. The average price of gasoline in Canada to garages is 31.25 cents per Imperial gallon, or 26.04 cents per American gallon. Besides freight, American gasoline must pay an import duty of 2½ cents, and there is also a war tax of 7½ per cent. Bad weather and increased production of crude oil in Canada was looked upon as likely to reduce imports in the central portion of the Dominion soon. Canadian gasoline is largely the product of imported American crude.

**Merger of Subsidiaries.**—It is persistently reported that some plan is under consideration whereby two of the Dominion Bridge subsidiaries, Montreal Ammunition and Dominion Copper Products, will be brought together into one company before long. Presumably the merger would be of advantage from an organization standpoint, and it is also probable that in a merger a basis of capi-

tal could be arranged more in conformity with the money invested in the two enterprises than exists under the present capitalization. From time to time there has been talk of the parent concern making a distribution to its shareholders of its holdings in both concerns, but it is not likely that any plan of the sort would be put into effect just now.

**Freight Rates not to be Increased.**—The Board of Railway Commissioners has decided that the time is inopportune to increase the freight rates westward from Atlantic ports, and therefore has taken no action on the application by the G.T.R., G.T.P. and C.P.R. for approval of a new schedule on freight bound west from Montreal, Portland, Maine and St. John, N.B. The proposed increase were opposed by importing interests. The commissioners are of the opinion that no hardship will ensue to the railways in determining that no action should be taken in this case until the effect of the Eastern rates judgment can be clearly demonstrated. The decision of the chief commissioner, Sir Henry Drayton, was concurred in by the others.

**Women Munition Workers.**—The Ministry of Munitions is about to open an instructional workshop in a suburb of London for the training of workers for the production of aero-engine parts. About 200 women pupils will be employed who must have been through preliminary training in a munitions school. At the new workshop the material for instruction will be part of the actual production. After training they will be drafted into aircraft factories, and during training, which will take from four to six weeks, they will be paid a maintenance grant. In charge of the women will be a woman engineer, herself a daughter of a famous engineer. It is proposed also to train women in certain forms of inspection, this being a new development of Government work. Some 300 men will also be employed at the new workshop.

## VICTOR Collapsible TAPS

Use these wonderfully big time savers.

## Remarkably Strong and Durable

THESE TOOLS ARE EXTENSIVELY USED FOR THREADING SHELLS AND OTHER WORK WHERE CLEAN CUT, ACCURATE THREADS ARE ESSENTIAL.

VICTOR TAPS are made with few parts, have machine steel body, high-speed steel chasers and are simple, strong, durable tools. A set screw adjustment from the front end maintains accuracy, automatic trip prevents spoiled work and there is ample adjustment to allow for wear.

**Victor Tool Company**  
Waynesboro, Pa., U.S.A.

# Shrapnel Shell Manufacture

By C. T. R.

*In view of the recent stimulus given to the output of 18-pdr. shrapnel, the accompanying article may not come amiss even if only by way of comparison as regards development in processes, methods and devices, employed.*

**A**T the plant under review, where 18-pdr. shrapnel shells are being manufactured, there existed a well equipped machine shop, so that a comparatively few new tools were required when the plant was turned over to the manufacture of shells. Some special equipment was of course required, such being necessary for this particular class of work. Existing machines were, however, tooled up and arranged in such a manner as to interfere as little as possible with the ordinary business of the firm. An interesting feature at this plant is the employment of women, who are engaged at present on the lighter operations such as washing shells, filling, and inspecting, etc. The experiment, it is understood, has been entirely successful.

The sequence of operations follows in a general way the order usually observed in most shrapnel plants. The first operation, that of centering the base, is done on a Cincinnati drill, the forging being held on a suitable fixture, which is pivoted at the base to permit the shell being handled without moving the drill table. The fixture, properly attached to the table, is thus always in the same position relatively with the counter-bore in the drill spindle.

## Cutting Off and Rough Turning Body

At the second operation the open end of the forging is cut off to an approximate length on a Davis cutting-off machine, with two cutting-off tools located on the front and back of cross slide respectively.

Two Davis machines are installed for this operation. The outside diameter of shell is then rough turned for about two-thirds of its length, the nose end being machined later. The nose end is held on a short taper mandril on the lathe spindle, while the base centre is on the tailstock. One roughing cut only is necessary. The lathes installed for this operation were supplied by the McGregor, Gourlay Co., Canada Machinery Corporation, Lodge & Shipley, and Walcott & Wood.

## Cutting Off and Finishing Base

The fourth operation consists of cutting off the base on a Davis cutting-off machine, there being three such installed. The machines are of the same type as used for the second operation, two tools being used, located on the cross slide for front and back.

The next operation is to finish the base and form the radius. This is done on an Alfred Herbert turret lathe, the turret holding a fixture with a facing

cutter in the centre, and another small tool at the side for forming the radius.

## Inside Bore, Powder Pocket, Diaphragm Seat and Outside Nose Profile

The sixth operation consists of roughing and finishing the inside bore, powder cup pocket, diaphragm seat, roughing outside nose profile, and facing up the open end. Four Warner & Swasey turret lathes are used for this work, each being equipped with a collet chuck fitted with a hand-operated draw back mechanism. The turret holds four tools for the inside operations, while the tool for forming the outside profile is held in a tool post on a cross slide. The first minor operation is to rough turn the outside nose profile, the tool in tool-post as noted above, being used. The open end of nose is then faced up with a slight bevel by a tool on the turret. At the third minor operation the inside bore of shell, powder cup pocket and diaphragm seat are roughed. The cutters are fixed in a boring bar held in the

turret and are adjusted to do these operations at one time. A similar tool is used for finishing the inside bore, powder pocket and diaphragm seat. At the conclusion of this operation the shell is cleaned out with compressed air and carefully gauged.

## Waving, Grooving and Under Cutting

At the next operation, which is the seventh, the copper band groove, waving and undercutting is done. One McDougal and one Butler lathe, both equipped with a

HEAT TREATING AND SHELL NOSING.

Bertram waving attachment, are used for this work. The shell is held in a chuck with the usual 3-point cam fixture on the face, while the base of the shell is carried in a cup centre on the tailstock mandril. The grooving and waving tool is situated in the front, and the undercutting tools at the back, all tools cutting at the same time.

At the eighth operation, that part of the outside diameter of shell between the groove and base is finished. The outside diameter above the groove is finished after heat-treating. A Fitchburgh lathe fitted with an air chuck is used for this operation, the tool being held in the tool post or front of cross slide.

#### Nosing and Heat Treating

The first series of machining operations have now been completed and the shell is ready for nosing-in, after which follows the heat-treatment. What was originally a somewhat delicate process in the production of shrapnel shells is now comparatively easy and there are now few rejections due to improper heat treatment. Improved methods and equipment and a better knowledge of the requirements have all tended to produce more satisfactory results. Before nosing-in, the shells are heated in a Tate-Jones furnace fired by natural gas. The furnace is rectangular in form and will take nine shells at once, each shell being put in a separate hole, nose end only. A heavy power press is used for nosing-in, the shell being held in a box chuck on the table and the dies in a fixture on the ram above. The shells are cooled gradually, being placed nose down in powdered mica during the process.

SETTING NOSE THREADS, FINISHING INSIDE AND OUTSIDE PROFILES.

The heat-treating plant consists of three circular Tate-Jones furnaces heated by natural gas. Each furnace will hold about twelve shells at a time, the temperature being around 1,500 degrees

Fah. The temperatures in the furnaces are indicated on a Canadian Hoskins Co. electric pyrometer. After being in the furnace about half an hour, the shells are taken out and quenched in a tank containing heavy oil. They are next dipped in a soda bath to remove the oil.

SHELL MACHINERY, WARNER & SWASEY LATHES IN FOREGROUND.

The shells should now have the required degree of hardness, but have to be tested on a scleroscope in order to ascertain precisely what this degree is and if it is sufficiently near the required limit to pass inspection. A test piece has already been taken from one shell selected at random from each series. This is tested for tensile strength and should agree approximately with the reading on the scleroscope. Before being tested on the "Shore" scleroscope, the

purpose. The shells are now ready for the next machining operation and are taken back to the machine shop on trucks.

#### Boring and Threading Nose, Inside and Outside Profile

The eleventh operation consists of

boring and threading the nose, and finishing the inside and outside profile. A battery of three Warner & Swasey turret lathes are installed for this work. These machines are exactly the same type as are used for the sixth operation, inside bore, etc., the tools only, of course, being different. The outside profiling tools, two in number, are situated in the tool post on front of cross slide, while the tools for the inside work are held in the turret. The tool for rough turning the outside profile is first of all placed in position at the end of nose and the boring tool on the turret is also placed in position. Both tools start cutting simultaneously. When the boring is completed, a cutter at the base of the boring tool faces up the nose. The turret is then moved round to the next position, and a reamer is put through the nose for the finishing cut. The next tool in the turret is a Murehey collapsible tap, which cuts the threads in the nose.

The following operation is finishing the inside profile. The tool used for this purpose is held in a special fixture in the turret. The tool post works in vertical slides on the fixture, and is placed inside the nose and then against the inside of shell to finish the profile. When this operation is finished, the tool is moved out, the turret swung round, and the next tool finishes the nose bevel or socket seat. While the turret operations are being performed, the outside profile is being turned. The first tool, already mentioned, while roughing the profile is travelling in the direction of the headstock. When the roughing cut is finished, the tool post is moving round and the second tool is placed in position to

shells are buffed on a polishing wheel so that greater accuracy may be obtained in the readings. A series of tests are made at various points, the shell being turned round by the operator for this

begin the finishing cut. The feed, however, is reversed, so that the tool travels back, away from the headstock towards the end of nose.

### Finishing Outside Shell Body

The outside of shell body has up, to this stage, been finished except the straight part between the copper band groove and point where the profile begins. The straight part is finished on a Ford-Smith grinder. Two large grinders installed for this operation, as well as two smaller machines. The method employed is essentially the same for all the grinders. The shell base is held in a chuck and the nose in a cup centre. The large grinders have a broad wheel and the shell is stationary, whereas the smaller machines have narrow wheels and the carriage with the shell travels backward and forward. The larger machines are fitted with a wheel trueing attachment. This completes the twelfth operation.

### Cleaning and Crimping Operations

There now follow a series of minor operations. The first of these is to take the shells to the sand blast to have the base and groove cleaned. They are then washed, first in a soda solution and afterwards in water. A new feature which has more or less recently been introduced in the manufacture of shrapnel shells is crimping or forming a small groove in the outside of nose near the end. This is done to secure a metal cover over the fuse as a means of protection. The operation is performed on an ordinary lathe with a special tool designed for the purpose fixed in the tool holder. At the side of the tool is a

### Copper Band Pressing and Turning

After a preliminary Government inspection, the shells are taken to another department to have the copper bands pressed on. The banding press was built by the Goldie & McCulloch Co., Galt, Ont., and is operated hydraulically at a pressure of 900 pounds per square inch. The press is of standard design, and is used in many shell plants, a full description is, therefore, unnecessary here. The copper band is first put over the groove, and the shell placed in the press. The power is applied three or four times, the shell being moved slightly after each application. The power for the press is supplied from a Deane triplex, belt-driven, pump, 1½ in. by 4 in., using an accumulator.

The next operation is turning the copper band on a Le Blond lathe equipped with a special fixture designed for the purpose. The shell is held in a collet chuck, while the nose end is in a cup centre on the tailstock. The tools are located on the cross slide, the back tool making the roughing cut and the front tool the finishing cut. The back tool does not feed down as in some cases, but is moved towards the work by operating the cross slide up to a stop. This operation completes all machining on the shell proper, that is with the exception of the brass nose socket, which is machined after the shell has been filled.

### Assembling and Filling

The assembling department is separate from the machine shop and a number of women are employed for this work. The first thing to be done is to hand-tap the nose, after which the tin powder cup is slipped into the pocket in base of

waste and the bullets poured in. After being weighed, hot resin is poured in and the shell is again weighed. The brass socket is then screwed into the nose and soldered to the fuse tube.

The brass socket which has been screwed into the nose, is in a semi-finished condition on arrival at this plant—that is, some parts of it have already been machined, and the grub screw hole has been drilled and tapped. The sockets are finished on a lathe with tool fixture on the cross slide. The shell is held in a chuck and supported by a carrier. The first tool forms a profile on outside diameter of socket to conform with that of the shell nose. The second tool faces up inside base of socket, cutting off the projecting fuse tube. The third tool forms the fuse seat. The socket is next hand-tapped and the shell cleaned. It then undergoes the final Government inspection, the plug being screwed into the socket. Painting the shells follows, after which they are shipped when dry.

### NOTES ON EFFECT OF BLAST-FURNACE GASES ON WROUGHT IRON\*

By Dr. J. E. Stead, F.R.S.

THE object of this note is to describe the effect of blast-furnace gases on wrought iron at temperatures between 400 deg. and 500 deg. Cent. The phenomena were observed quite incidentally when experimenting on the magnetic properties of manganese steels with the object of ascertaining the effect of very prolonged heating at relatively low temperatures. Bars of steels were placed inside a wrought iron tube or case, and the case with contents was placed in the middle of a gas flue, where the temperature ranged between 400 deg. and 500 deg. Cent., and was allowed to remain there for nearly two years; the case and the bars were however removed and examined at intervals.

After exposure for a year the wrought iron tubes were found to be blistered in many places, and at certain points layers of the iron had been torn away from the places where the screwing terminated and were beginning to curl over. As one had the opportunity of examining the outside of the case at intervals, the gradual and progressive tearing action was being followed. From the first it was clear that carbon was being deposited from the gas, and was responsible for causing the disruption. On screwing off the cap to get at the bars, a considerable quantity of fine, dense, black powder fell out with the bars, and the lower part of the upper tube contained much of the same substance loosely adhering to its sides. In physical appearance the powder resembled lampblack. All the blisters on the tubes were filled with this black powder, and some had deposited

\*Iron and Steel Institute contribution

FINISHING OUTSIDE SHELL BODY ON FORD-SMITH GRINDER.

guide for locating the tool in the proper position in relation to the end of nose. At the next operation, the markings on the shell body are stamped on in a marking machine.

shell. The diaphragm is already in, having been dropped inside the shell immediately preceding the nosing operation. The brass fuse tube is then screwed into the diaphragm, the tube plugged with

on the inside walls of the thicker tube as well as the walls of the thin tube.

Originally these walls, as well as the exterior surfaces, were coated with a thin layer of blue scale, as is usual with all such hot rolled material. Carbon seems to have deposited over the whole interior surfaces, but none at all on the exterior portions, excepting at the parts which had been cold distorted at the screwed portions beyond the terminations of the caps. The larger amount of manganese in the deposit found in the case itself suggests that a portion of it had come from the surfaces of the manganese steel bars. As the caps were screwed tightly on to the ends of the case, it was supposed the latter was quite gastight, and if it was, one is forced to the tentative conclusion that carbonic oxide passed through the solid iron. That it is capable of penetrating iron to a depth of about a quarter of an inch at 600 deg. to 650 deg. Cent. has been proved by previous experiment, but that it should penetrate right through the iron and deposit carbon on the inside walls of the iron tubes at under 500 deg. Cent., if true, is very remarkable, and further trials are being conducted to confirm or negative these observations.

On testing the black deposits for carbon by color, only traces were found in the deposit from the upper tube, but 0.21 per cent. in that from the lower tube; a portion of this may have come from the manganese steels, which contained up to 2 per cent. carbon. Incidentally, it may be remarked that at high temperatures spongy iron reduced from iron ore is rapidly carburized, and it is justifiable to believe that as ore is reduced and descends down the shaft of a blast-furnace it becomes highly carburized before it reaches the melting zone, and not, as is usually assumed, that it remains as spongy iron till it begins to melt. It is more than probable that before the reduced iron is half way down to the hearth it will have combined with at least 2 per cent. carbon.

In reviewing the result of the observations and experiment given in this note, it would appear:—(1)—That even hard and refractory iron scale and the magnetic cinder enclosed in wrought iron are capable of reacting with carbonic oxide at temperatures between 400 deg. and 500 deg. Cent. (2)—That wrought iron containing free oxides is capable of being partially broken up by the action of carbonic oxide gas on the enclosed oxides or cinder. (3) That under the conditions named even initially non-oxidized steel acts on carbonic oxide gas, inducing carbon to be deposited on its surface.

## BRITAIN'S INCREASING MUNITIONS PRODUCTION

CANCELLATIONS of large contracts for arms and munitions placed in the United States by Allied Governments are not altogether unexpected when viewed in the light of a speech made by Mr. Montagu, British Minister of Munitions some few weeks ago. The enormous increase in Britain's facilities for producing munitions of every description were apparent from the fact that apart altogether from national shell factories, the great armament firms of the country had made extensions amounting to 1,000,000 sq. ft. and had installed upwards of 2,500 new machines to carry out the Army gun programme alone. The Minister of Munitions was of course not quite definite in several statements but it was gathered that, apart from the eighteen factories for filling ammunition, all of which have been ordered, planned, and built during the last twelve months, and thirty-two small national shell factories, there are, further, twelve large factories in various stages of completion, occupied in making heavy shell, which were barely working at one-half of their proper capacity. These buildings, Mr. Montagu stated, cover an area of 70 acres, or about twelve times the space devoted to gun factory extensions. The bays average 14 ft. deep and have a total length of 15 miles. Apparently all these are independent of factories for fuse or cartridge manufacture.

## CENTRAL DEPARTMENT OF MINERALS AND METALS

THAT the department of minerals and metals maintained by some of the British Dominions are a feature worthy of adoption by the British Government was the opinion expressed by such leaders of industrial thought and action as Sir W. Beardmore, Geo. Beilby W. Thornycroft and Edgar Taylor, in a recent communication to the Chairman of the Advisory Council for Scientific and Industrial Research.

The argument put forward is that while there are similar well-organised departments in some of the British Dominions, there is no connecting link or "clearing" house in the Metropolis of the Empire. Various departments of the Home Government have all been concerned with the collection of information bearing on the sources of supply of minerals and the production of metals, but there does not seem to have been any serious attempt to co-ordinate and render available this information, and it is certain that there has been considerable overlapping and duplication of effort with corresponding waste

and confusion. In the opinion of the Institutions represented by the signatories the organization of a central Department of Minerals and Metals is imperatively necessary in the public interest, and the work of organization, which will necessarily take much time to complete, should be begun at the earliest possible moment.

"It cannot be doubted," the letter proceeds, "that if a properly organized and efficiently conducted Department of Minerals and metals had been in existence, much valuable time, many lives, and vast sums of money would have been saved to the nation in the conduct of the present war, and much of the cost and inconvenience to British industries depending largely for their raw materials on mineral products would have been saved, with corresponding advantages to the prosecution of the war and to many industries."

The following are given as among the duties of the suggested new Department:—

1. Arrangements for expediting the completion of mineral surveys of the United Kingdom and the Crown Colonies and other British Possessions.

2. The systematic collection and co-ordination of information bearing on the occurrence, uses and economic value of minerals and their products; special attention being devoted, to securing industrial applications for newly-discovered minerals or metallurgical products, and to finding mineral materials required for new metallurgical products or inventions.

3. The investigation of all questions and problems relating to the utilisation of the mineral or metallurgical resources of the Empire.

4. The co-ordination and dissemination of information.

5. A general review from time to time of the developed and undeveloped mineral resources and of the position of each mineral or metal, to ensure that the mineral wealth of the Empire is being exploited with due regard to Imperial interests.

6. Generally, to advise the Imperial Government on all questions bearing on the mining and metallurgical industries.

**Discipline.**—Many of the accidents which now occur may be eliminated by discipline—not after the accident occurs nor as administered to an offender; but the kind of discipline which originates within the man, which he applies to himself. True discipline is an education, a development of faculties by instruction and exercise; it is a training to act habitually in accordance with established rules; it is a training to obey either a superior or one's own mind immediately and without question.

# PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data  
and Ideas Evolved from Actual Practical Application and Experience

## THE MANUFACTURE OF SHRAPNEL PLUGS—II.

By J. Davies.

THE blanks having been cast and the die heads assembled, as described in the previous article, the mechanism for handling the work and dies is now discussed. Next to the required accuracy, the question of output was most important, and the manner in which this was satisfactorily accomplished is now described.

### Machine for Threading Blanks

Many experiments and different machines were fitted up for threading, and some idea of the general construction of the simplest and most efficient can be gathered by reference to Fig. 6. A piece of cold-rolled shaft A is turned to fit the bearings B and the gear C. It is free to slide through the gear C, being driven by a feather key. It is bored out in the end to receive the steady plunger D and spring E, the outer end of the plunger being made to fit the end of the plug. In the back end of the shaft A is fitted a lead screw F, working through a brass bush G, which can be prevented from rotating by screwing down the cap. This lead screw regulates the position of the die and keeps the pitch exact. The die holder or chuck is keyed on the other end of the shaft. The plug is driven by a hardened piece of steel squared to fit the cored hole in the plug, and fitted into the end of a sliding sleeve worked by a lever and toggle joint. The joint is made to lock itself in position when the plug is ready to be threaded.

The machine is driven through two friction clutches I and an intermediate gear is threaded to receive the reverse screw J, which is prevented from turn-

ed up by the adjusting collar, and the spring forces the friction into the other clutch, thus reversing the machine. The machine continues to run in the opposite direction until the adjusting screw pushes the friction into mid-position,

FIG. 7.

when the machine stops for the removal of the plug.

### Facing or Grooving

Facing or grooving is done with the same machine as the threading. It is not necessary, however, to have a leading screw or a reverse screw, as the machine must run continuously in one direction until reversed by the operator.

Fig. 7 shows the method of holding the plug during the facing operation. A cast steel sleeve A is made to fit the gear B. This gear has a long bearing boss cast on each side of it, which fits into the pockets of the machine C. One end

The plug only goes into the sleeve for about three threads, so that it is an absolute necessity to have the plugs a snug fit into the sleeve. The sleeve itself can be adjusted after being ground by means of the threaded flange D. The plug is prevented from going too far into the threaded end of the sleeve by the hardened steel piece E, which is adjusted by means of the screw F, secured in position by the lock nut G.

An ordinary or improvised rest is bolted to any convenient part of the machine; only one slide is necessary, as both sleeve and plug can be adjusted. The tool is practically a forming tool, being ground to the exact shape. The plug butts up against the piece E, and the tool is fed in straight to the required

FIG. 8.

depth. After the facing operation, the plugs are taken out of the chuck by inserting a bent bar, squared to fit the hole in plug, and then reversing the machine.

### Rectifying Variations in Work

In the final inspection the plugs must fit the gauges exactly on the bevelled face, and also be the exact length. Some may be a little short and some a little long—the short ones are put back into the machine and re-faced, the long ones are spot-faced in the drill press.

The jig shown in Fig. 8 is used for the latter purpose. A cast iron block A is fitted with a hardened square centre to fit the plug; B is a bush made to drop over the threaded portion of the plug and fits the bevelled face; C is an end mill fitted with a collar D, which regulates the amount to be milled off the end of the plug.

### SHELL RESEATING MACHINE.

By Geo. Armstrong.

THE machine shown in the accompanying sketches was built for the purpose

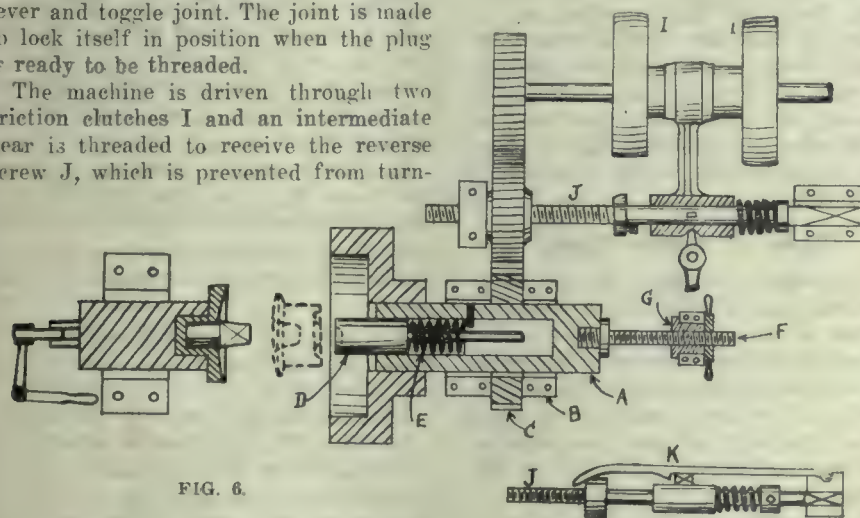

FIG. 6.

ing round by its squared end fitted into a suitable bearing. The machine is started by a hand lever, which operates the friction clutches, the driving clutch being held in position by the lever K as shown. When the machine has travelled the required distance, the lever K is lift-

of the sleeve A is bored and threaded to fit the plug, the thread extending into the sleeve for three or four inches, so that as soon as the thread wears the least bit loose, the sleeve is taken out and a piece ground off the end.

of accurately re-seating the noses of shells—that is, to form the beveled mouth accurately and true with the body of the shell when the work done by the regular methods did not meet inspection requirements. The shell is gripped in a swinging clamp A, hinged to the upper part of the main frame B. Supported

FIG. 1.

in a bearing mounted on the front of main frame, is a cutter spindle, the upper end carrying the cutter C and the lower end a bevel gear driven from belt pulley D.

The cutter spindle is hollow and through it passes a feed rod E, the upper end having a stop pin F, for the shell to rest on, and a threaded portion G, which fits the shell nose. By means of feed lever H, the shell can be drawn down on top of the revolving cutter C, while the shell is kept from revolving by clamp A, which, however, is free to travel vertically to allow the shell to feed down on the cutter.

When placing the shell in position, the feed rod E is revolved rapidly by hand

FIG. 2.

crank J, to enter the threaded portion in the shell nose. A clutch is shown for stopping the cutter while changing shells, although any other method of control is equally suitable.

## LITTLE KNOWN FACTS ABOUT GRINDING—CHATTER MARKS

By Howard W. Dunbar.

THERE is a common belief among users of grinding machines that, invariably, chatter marks are caused by gearing in the headstock. To the uninitiated this might sound feasible, but those who have spent years in experimenting and years of investigating on grinding problems have long since discovered that it is more often true that chatter marks are caused by many other things, and that only rarely can chatter marks be charged to gears.

While there may be such a thing as imperfect gearing in machines when the work is driven with gears, and this imperfect gearing may cause marks in the work, it is more often the case that the gearing is correct, and that marks are caused by some other thing independent of anything in connection with this gearing in the machine. In the minds of those people who have made a study of this chatter mark question there are chatter marks—and then again there are other chatter marks.

There are marks which are perfectly evident in a ground piece of work without the aid of a microscope, without the aid of a lap, and they may be seen several feet away from the work. Then there are other chatter marks which, upon the closest inspection, are not evident on the surface of the work, and cannot be seen until they have been lapped with a perfect lap, which polishes off the high spots and brings out the chatters. These, for want of a better name, we choose to call "invisible chatter marks," and they are evident in work which is driven by a belt, by a chain, or by gears, or any other known method of work drive. Marks which are clearly evident on the surface, without any outside means for bringing them out, are apt to appear in any form of drive, but can be removed from any form of drive by observing certain laws and principles, and this applies equally well to the gear-driven headstock.

### Causes of Chatter Marks

We are giving below a list of things which we have actually found will cause chatters in work, simply that the reader may—when he has trouble with chatter marks—look to some other source for his trouble, rather than turning to the gears in the headstock, without investigating what may be the real source of his difficulties.

1.—Improper speed relation between wheel and work. Speed of revolution is important and cannot be ignored, no matter what the design of the machine, and no matter what the method of driving the work. The proper speed of revolution and the proper wheel must be selected to prevent imperfections in

grinding, and whoever ignores this fact will simply have his troubles for his pains. It is better for us to recognize these physical laws and obey them, rather than to attempt to avoid them and try to get something for nothing, which is always impossible.

2.—Improper use and not a sufficient number of steadyrests, whether the work is being revolved direct by belt or by gearing, or by some other means. If the work itself vibrates while the wheel is rubbing upon it, these vibrations will cause imperfections in the work being ground. Sometimes they will be visible to the eye before lapping; other times they will be so small as to be invisible until the work is lapped. The best way to overcome this—and the only way—is to use proper steadyrests, and the stiffer these steady rests are the more rapid will the work be done and not cause chatters.

3.—Vibrations of steadyrest shoes because they are loose in the holders.

4.—Uneven thickness of belt driving the wheel or the work. More often the wheel belt causes trouble because of the uneven thickness of the belt when a lump comes over the pulley and sends the vibration out through the spindle to the wheel and thus to the work; when a great many lumps in the belt keep doing this, a great many vibrations are set up. The only cure for this is to true the belt off to a uniform thickness, using a carpenter's chisel as a lathe tool, and rigging the belt up to run over a drum, passing the tool in front of it and making it of uniform thickness.

5.—Poorly cut gears, unevenly spaced and rough on the face. These are seldom found in a geared headstock, and only found when some one has been neglectful and inspection not rigid enough.

6.—Improperly trued wheel. If the wheel is not trued perfectly round and straight on the face, of course work cannot be expected to be any more perfect than the wheel is.

7.—Poorly fitting centres. Centres that do not fit in the taper perfectly will vibrate and cause chatters in the work.

8.—Loose centres and centres that are not round. All can be classed with the above.

9.—Centres in which the taper in the centre hole is greater than the taper on the centre point.

10.—Centres not properly lubricated.

11.—Poor fit of surfaces on wheel slide which is a result of wear caused by moving the wheel slide back and forth in a small space on special work requiring only a short motion.

12.—Attempt to force production on machines too light for the work being ground will cause conditions noted above.

13.—Irregular rotation of work or wheel, caused by loose belts, change in

voltage or power, slipping of belts, etc.

14.—A change in the surface of the wheel, such as glazing or filling, which causes a different action of the wheel at different points on its cutting face.

15.—Wheel out of round, caused by the wheel being brought up against the work without any lubricant on it, which breaks away the face of the wheel, and every time such a spot comes around on the work it leaves its mark.

16.—Loose wheel spindle. A case in which the wheel spindle needle needs adjustment.

17.—Wheel out of balance will cause vibrations all through the machine, the wheel slide, the work table and the work itself, which will cause chatters.

18.—On crankshaft pin and bearing grinding chatters are sometimes caused by the cheek of the crankshaft not being cleared away sufficiently to allow the wheel to pass by without touching it, as the crankshaft revolves by the side of the wheel. This causes a vibration in the wheel and in the work which is responsible a great many times for a large amount of the chatters in crankshaft grinding.

19.—Too weak driving pin. Will not allow the work to be revolved with a uniform motion.

20.—Heavy and long revolving parts running at high speed being out of running balance. All cause chatters.

21.—Work not tight on the centres.

22.—Centre points which are not true, and centre holes which are not round. No work can be more accurate than the centres and the centre points.

23.—Wheel loose on wheel sleeve, causing the wheel to slip.

24.—End play in any revolving shaft running at high speed, which has collars on it that might knock against some frame work or bearings on the machine.

25.—Motors used in connection with the machine in which the armature is not in running balance, vibrations from which will cause marks in the work being ground.

#### Geared Headstock Factor

It is probably true that the grinding machine to-day would not be possible of as great production and hold the important position that it does in the machine tool field were it not for the geared headstock. Gears and geared forms of drive will increase in number rather than decrease. The gears themselves may be made better and more perfect, but it is true that their use will be employed to greater extent than ever before. All efforts up to the present time on the part of users of grinding machines to substitute belts or other forms of drive for gears in the work drive — except where the work is very small and light — have only been a temporary expedient and sooner or later troubles arise, either

from lack of power, lack of speeds or some other unforeseen reason.

One manufacturer who solicited our efforts in providing him with an extra nice, specially designed headstock to provide for a specially smooth and nice uniform motion of revolution for the work drive, frankly admitted to us that the only reason that he wished to grind work free from these very small invisible chatter marks (which could only be brought out by lapping), was to overcome the letters of complaint coming from foolish and unreasonable customers who required ground work free from these little blemishes. He stated that it was tradition which led to this, and that they must attempt to meet tradition in order to protect themselves against these unreasonable letters and complaints.

There are probably many other things which cause chatters, but these are some of the most common things we look for when we have trouble, and which must be corrected if one wishes to produce work which shows absolutely no blemishes. It is doubtful if it will ever be possible to produce commercial work that a determined critic cannot find some faint chatter or blemish in by lapping with a perfect lap and a little abrasive, but such tests are not sensible ones to apply to any ground work, for the reason that anything requiring a more accurate surface must be lapped anyway and marks which are evident in the work and are visible to the naked eye can be removed, whether they are ground with a belt drive, gear chain, chain drive or any other form of drive headstock.—*Grits and Grinds.*

#### RE-MELTING CAST IRON TURNINGS

NO engineering works that includes both a foundry and a machine shop can consider it satisfactory in these days to sell its cast-iron turnings to the puddler at \$15 a ton, says *Page's Weekly*, while it is at the same time buying machine scrap for the foundry cupola at anything up to \$24.50 a ton; for, after all, they are the same article, except that one is in granular form and the other in the lump. Indeed, of the two, the turnings are preferable, for they comprise the known standard mixture of the works, and are not so apt to contain unpleasant surprises as is miscellaneous scrap. Here is a margin of \$7.30 to \$9.70 a ton which can be saved to the works, provided a means can be found of charging the turnings into the cupola. As is well known, it does not serve simply to tumble the turnings loose into the cupola. If that is done there is a heavy loss of metal, amounting in some cases to as much as 75 per cent., whilst even that portion which survives and runs down into the well

yields a metal heavily charged with sulphur and other impurities. To ensure economical melting it is necessary to feed the turnings into the cupola in a compact mass, so that they shall melt after the fashion of a lump of pig iron or scrap.

One way of doing this is to compress the turnings into a block by placing them in a suitable mould, and bringing down upon them a hydraulic ram working at about 14 tons pressure. This process is in fairly general use. It yields briquettes in the form of a cylinder, which may be perhaps five inches in diameter and four inches in height. With some irons, a compact block can be made without any binder, but, in other cases, lime-water, powdered lime, or some other cement has to be used to assist cohesion and prevent premature disintegration in the cupola. The cost of briquetting varies from 50c to \$2.50 a ton, according to locality, circumstance, and equipment; but even at the higher figure there is an ample margin of saving over selling turnings and buying scrap—provided the melting is satisfactory.

#### CAST IRON SHELL

IT would seem as if the continued consumption of shells on a vast scale by the belligerent powers would ultimately demand a radical change in methods of manufacture, and the fact that efforts in this direction are being made

FIG. 1.

FIG. 2.

in some quarters is evidenced by frequent references to, and articles on the production of, cast iron shells. According to a writer in the *Practical Engineer*, cast iron is used in some of the smaller shells, made for penetrative work, and in order to give them additional penetrative power, the noses or points are rather deeply chilled—a feature which to some extent removes the job from the ordinary run of moulding work. In the first place, the flasks must be specially made for the work, special chills of considerable

thickness must be used, and the cores must be of special construction, while, in the second place, the working must be exact to the 64th of an inch, or there will be too many rejections to make the job pay.

Roughly, the shells are as shown in Fig. 1 in section, it not being necessary to give exact dimensions, and unless the shells are turned inside as well as out the walls must be of equal thickness, or when fired the shell will gyrate too much, instead of spinning regularly on its flight from the gun. Usually, however, the

FIG. 3.

shells are turned and bored, the hardened points being ground, as they are too hard to machine with an ordinary tool, this making it necessary that the shell be cast axially true to save over grinding on any side of the axis. An entirely soft shell could be more or less rectified in turning, but a well cast article is best.

#### Core Feature

The cores should be struck up on a hollow perforated barrel, the general construction of which is as shown in Fig. 2 in section, together with the fittings used to secure rigidity when in place in the mould. Being quite enclosed, the cores have to be rigidly held from the cope, and a proper print must be on the pattern to ensure that the exact position is held during pouring.

The chills must be thick to be effective, or they will not carry off heat fast enough, and in regard to this we consider that both flasks and chills should be specially made for the work on some standardized interchangeable plan, and where machine moulding is adopted, this can be carried so far that cost of production can be reduced to the lowest possible point. The possibilities of machine moulding are such as few persons can foresee, but, like almost everything connected with the iron foundry, very little attention is really paid to this class of work, and hand moulding is generally used owing to its causing little trouble to initiate.

According to size the castings may be made singly or in groups, and the flask in section would appear very much as shown in Fig. 3, and if poured with clean iron the castings would come out well without segregation. The cores should be well blacked to prevent the inner part of the casting being gritty and bad to cut, plumbago being the best blacking to

use for this kind of work. The metal must be poured hot and fluid, while the castings may be poured singly or in groups, this being dependent on the practice of each foundry.

The grooves should not be cast in, but machined, as this tends to more rapid production, the saving of time in moulding more than compensating for the time taken in cutting the grooves.

Of course it is possible to cast shells on the side, but, owing to the liability of the cores to float, there is no great certainty of the castings being true enough to pass inspection, and in any case they are unequal in weight as between the upper and lower sides in the mould, this being rather a serious matter in regard to their accuracy when fired, there being a tendency to gyrate when the weight is not balanced radially in the body of the shell, a point which tells somewhat against their increased use.

#### Unchilled Shells in Permanent Molds

Unchilled shells can very well be cast in permanent moulds, should such shells be needed, and in regard to this they could be produced ready for use if we except the bare skimming over the outer surface. With a sufficiency of moulds, and a trained body of men exclusively employed on this work, the output would be continuous and large, but of course every item of the process must be methodically arranged, the melting of the metal being continuous from start to finish. A double set of moulds would be advantageous, as it is desirable that the moulding surfaces should be kept

FIG. 4.

polished with plumbago, while an abundance of iron cores should be provided to secure replacements where one or more gets fast in the casting. The cores also should be kept well coated with plumbago, this acting as a lubricant, and also leaving a smooth surface on the interior of the shells, which is a large advantage. A section of a shell mould is shown in Fig. 4, with the core in position.

In working the mould would be closed and locked with the cores held tightly in

position, then poured, and as soon as the metal is set, but before the contraction sets in, the core withdrawn with a spiral motion, and a few moments later the mould would be opened and the shell thrown out while still bright red-hot. It must always be remembered in this kind of work that contraction does not commence for an appreciable time after the metal solidifies, and in this stationary period there is ample time to remove metal cores, but, of course, the exact point of removal can only be found out in practice by the workers. In no case is the metal chilled when cast in permanent moulds, where the castings are thrown out hot, but the texture of the metal is different to that cast in sand moulds. For shell work permanent moulds offer possibilities, but, of course, chilled work is out of the question with these.

#### SHIPBUILDING IN BRITISH COLUMBIA

IT is of interest to note that there are fully twenty-five wooden ships now under construction on the North Pacific Coast, between British Columbia, Puget Sound and Oregon ports. The vessels, though rigged as five-masted schooners, are properly classed as motor ships of the general type which the Swedes and Danes have perfected to such a degree in recent years. The design for these new vessels is a new departure in naval architecture. The vessels are built on low lines, with minimum amount of space which cannot be used for cargo. It is estimated by the designer, J. H. Price, that the cargo space of these vessels is 95 per cent. of the whole.

The general dimensions of the new vessels are given as 44 feet beam, 21 feet depth, 225 feet keel, with length over all 265 feet. Their lumber capacity is figured at 1,500,000 feet, considerably over the average of the old-time windjammer. Power is furnished by two Bolinder engines of 160 horse-power each. These engines are of Swedish design, Diesel type, using crude oil fuel. Without the aid of the sails it is figured that the engines will drive the ships at a seven-knot rate, loaded.

British Columbia's new fleet of lumber carriers will have the distinction of being the first ships to be built under and classified according to the new rules of Lloyd's Register of Shipping. Because of radical changes made in wooden shipbuilding on this coast in recent years, changes which are considered to mark great progress, most recently built vessels had been classified under other shipping registers, as Lloyd's rules had not been altered and were rather strict with respect to the changes which had grown up.

## THE ENGINEER AND HIS ADVERTISING—II.\*

By Chas. B. Penwarden.

THE following question is in the nature of a conundrum:—Assuming you had sat for eight solid hours working through the advertising pages of British Engineering Trade Journals, how many advertisements would you be able to recall after the expiration of two weeks? I tried this out myself, and I was able to remember, without effort, but one firm, and I remembered that firm by name and by the goods advertised because they, or whoever did the work for them, understood the use of both white space and illustration.

### The Illustration Feature

Does an engineer know what a steam engine is, what an electric motor is, what a factory is, what an oil can is, what steel rails are, what a thousand and one things are which are in daily use amongst his fellow craftsmen? It seems an absurd question to ask, but on the answer depends the decision whether engineers as a class have money to burn or not, for, if you go through the journals, you will see square yards of space taken up with more or less attractive pictures of this type, costing considerable money for photos and blocks, and still more for space occupied. Imagine the exaggarate amount which has been paid to show the engineer pictures of things with which he is perfectly familiar, and which will not induce him to spend a penny. Business men do not buy engines, motors, and a thousand other engineering necessities through seeing a picture, but they would certainly study the advertisement more if those pictures, instead of being dull and inanimate, possessed action, individuality and suggestion—really told things.

Sometimes I have tried very hard to imagine myself in the position of a buyer with a fair amount of money to invest in engineering material, and I have gone through the trade papers on a search for reasons why I should buy certain goods. Those reasons have never been discovered because they were not given. Recently I had occasion to go through the works of a big engineering firm, and one of the directors very courteously assisted me in my search for knowledge regarding a certain article. In return I went through his advertising matter.

This gentleman said that he had come to the conclusion that his firm's advertising was not effective, and he had set to work to find out why. The results of the changes he made were amazing, and more direct enquiries had been received from one short series of particular advertisements than could be traced to many times the number of advertisements of the old style—just name, address, business, and the usual insipid and money-wasting specimen of illustration. I asked him why it was that engineering advertising, as a whole, was so terribly weak and wasteful, and he, quite seriously, said that as it was all alike everybody seemed satisfied, but no doubt that as soon as one or two firms took the trouble to raise the tone others would follow suit.

What a confession! What an amazing situation that men engaged in one of the most important professions in which human energy and enterprise is employed, men who are trained in precision, foresight, calculation, and carefulness, who must, by the very nature of their occupation, be always striving for newer and better ways to do things, should ignore the tremendous possibilities in efficient publicity at home and abroad because they are all as bad as one another!

### The Great Importance of Selling

It is all very well to say that when the British get to work they do things. It is not sufficient for any business man to be capable of making things efficiently. To-day he must also be capable of selling them. As a matter of fact, the selling side is, in many respects, more important than the manufacturing side. While we may see, at periods of our history, many capable mechanics out of work, nobody will ever see a capable, hard-working, dependable, and successful salesman out of a job.

Emerson has said something to the effect that if a man will make a better mousetrap than any other man, the crowd will make a beaten path to his door, though it be in the depths of a forest. That might have been the case in Emerson's day. It is not so now. We move and live too fast. While the superior workman is waiting for the crowd to find out where he lives, the capable salesman is scooping in all the possible orders—especially if he uses publicity to the best advantage. So with the engineer.

While so many firms are depending upon their sadly wasted space to remind possible clients that they make a certain class of goods at the same old stand in a

certain locality, and are patiently waiting for the time when somebody finds the need for their goods, the wide-awake, up-to-date advertiser is telling those who form his market all they would ask about the goods if they were face to face, and, instead of waiting for business which might come, is creating business by rousing his readers to action through stimulated desire.

Take a certain motor car which appeals to a particular section of the community. We may laugh or sneer or tolerate according to our personal temperaments, but we cannot deny that that particular motor-car is being made and sold by the hundred thousand every year, and that the number of owners runs into millions, or that it is to be found in every country on earth, from the arid plains of India to the lonely hills of Klondyke; mainly through the power of properly understood and controlled publicity.

### The Indispensable Engineer

Now to the engineering industry as a whole is due the honor of the world's industrial progress. Far in the van of civilization goes the trained engineer, and probably no further progress could be made without him. It is to the engineer we look for increased production, for many things, in short, that help to make life worth living. It may be the gas engineer, or the electrical engineer, or the mechanical engineer, but somewhere in the scheme of new things will be found an engineer. Therefore does it seem the more inexplicable that, in every branch of the engineering profession, disregard or ignorance is so universally shown of a power equally as great in its own way as engineering itself.

There are many reasons for the existence of engineers, but there is only one reason for the existence of publicity as applied to trade, and that is to secure more business and make more money. There has never been a time in the history of any country when the selling side of any commodity which can be exported needed so much attention and care. There has never been a time in history when business men needed to watch so carefully and continuously the stream of foreign-made articles of every imaginable character being landed on our shores, and paid for by good solid gold which ought to remain with us—articles which could and should be made by our own workmen and sold by our own salesmen aided by intelligently handled publicity.

The average engineer either cannot or

\* *Herbert's Monthly*.

will not see that advertising—paper, ink and brains—is becoming every day a more and more indispensable auxiliary, an increasing necessity—not a luxury or a speculation—in his scheme for increasing output. That output will have to be increased from a national standpoint is certain, for never has there been a time when so much leeway had to be made up. The devastation of war, the transference of accounts and business to firms hitherto practically unknown, the switching over of thousands of firms on to war work, and their consequent dropping into comparative oblivion; the energies of neutrals in markets which the belligerents have been forced to relinquish, even though temporarily, and a thousand and one other causes will impose upon the engineering industry as a whole a burden it has never yet had to carry—a burden of dead weight, unrelieved by any of the advantages which might have been secured ten or twenty years ago.

### One Thing to Claim—Another to Prove

Our goods may still be the best in the world—but, on the other hand, they may not. We may still dogmatically claim that we can beat the world, but something more than claims is needed now. We have to deliver the goods; but, what is of equal importance, we have to create the demand; and, when the demand is created, we have to see to it that our customers are given what they want, not what we think they ought to have.

It does not come within my province to speak of the conservatism and obstinacy of the average manufacturer, who, with an experience of travel extending perhaps to Paris, presumes to know just what people in the Far East or in other parts of the Empire should buy, although from experience I could say a good deal about that subject, but it does come within my province to speak of the imperative need for greater and more careful study and consideration of the problems of modern selling—especially by means of the printed word.

I had recently a typical experience of the average Englishman's attitude towards the buyer, and a more short-sighted policy it would be difficult to find. The firm in question publish a series of books in which engineers of all grades are invited to advertise, and in which a large number of firms do advertise. To the managing director I said:

"What do you do to help the advertiser to get results?"

"Do!" said he. "We print the books and send them to so-and-so and such and such places."

"Yes, but I mean what do you do to help the advertiser to get the best out of the space he buys? Do you write or suggest any copy for him?"

"Copy? Not likely. We sell the space, and he can do as he likes with it. Supplying copy is his job, not ours."

The point is that the employment of a man or men to prepare copy at a cost of about one per cent. would have resulted in a further profit of nine per cent., as the price of the space could easily have been raised another 10 per cent., the value of it being probably 25 per cent. extra on account of the proper use which would have been made of it. I am not going to say what an American or a German would do under the circumstances, because I don't know, but I want to point out that a great amount of business is lost and a vast amount of money is wasted by engineers in their advertising because they will do nothing to help the consumer buy.

### The Power of Suggestion

If the publication manager referred to had laid himself out to improve the advertising in his books he could have secured a great deal more business at a great deal less cost, and made an additional 9 per cent. on top of it. If the advertising engineer would realize that the man he is appealing to in his advertisements is a being of flesh and blood and brains and nerves and most of the weaknesses man is heir to, he would at the same time realize that the power of suggestion is quite as potent in his case as it is in the case of a pill manufacturer, although it should, naturally be used in a different way.

So that the pictures of ordinary steam engines and motors and steel rails and the hundred other everyday articles illustrated at a certain expense which represents waste should be scrapped and pictures used which contained the power of suggestion, showing things worth knowing and giving distinction and individuality to the whole advertisement, I ask:

What does your article do?

What is it for?

What is its value as a money saver; as a time saver; as a labor saver; as a producer?

According to the manner in which any one of these questions is answered will the point of contact be found in the reader. When your advertisement, through whatever cause, makes a man think "Yes," it has reached a point of contact with that man's ideas, and you have his interest. That is why all advertising should be written in a strong, positive sense.

### Thinking Backwards

Now most engineers think backwards. They make an article and put it into stock or in the showroom, or wherever they usually put the finished product, and say, "That's ready for sale." On the other hand, if they made to order, they get all ready, and, in effect, say, "We are now ready for your esteemed commands," or something equally inane. They are ready to sell; but is the other party ready to buy?

Around the answer to that simple question is involved all that makes the difference between failure and success. If the other party is not ready to buy, there is not much use in being ready to sell. Obviously, then, it is a part of the engineer's duty to see that the other party is ready to buy. It is his duty to preach, to coax, to persuade, to educate, to suggest, to stimulate, or do any other lawful and legitimate act in order to induce the other party to make up his mind that he is ready to buy, and, that accomplished, the sale is easy.

Travellers, in their reports, often say, "He is not ready to buy," and leave it at that, but it is the traveller's duty, as it is the duty of the advertisement, to persuade the buyer that he is or should be ready to buy. Why? Because when a man is ready to buy is just the time when competition comes in. Everybody knows when a man is ready to buy, but if an advertisement convinces him to the extent of making up his mind quicker, the article properly advertised will get preferential treatment.

No advertisement which gives a picture of a little boy holding aloft a reel of cable and taking a whole page to do even that (an actual fact) is likely to sell much cable, neither will an advertisement, which takes three-fifths of the available space to show a picture of a locomotive, sell many locomotives.

### Is Your Expenditure Proving Profitable?

In considering these things, we have to bear in mind that they apply not only to the goods which we wish to sell at home, but even more so to the goods we wish to sell abroad. There is something of a craze just now for considerable advertising in journals with a repute for foreign circulation, the object presumably being to secure some of the business which is supposed to be "coming along," as the expression goes. In my opinion, however, something more than bare catalogue details will be essential if the money spent in this direction is to come back again with profit; so, in this consideration of the essentials—or some of them—of commonsense advertising, take a ramble through the engineering advertisements in the trade papers, and try to find more than about one-half of one per cent. that answers even one of the questions asked above.

In taking this ramble, think of the good money that is being spent in paying for the space those advertisements occupy. Think of the hundreds of thousands of pounds expended in the course of a year in trade papers, catalogues, directories, and other media for no purpose than to say: "I am Jack Jones, of Halifax, and I make Friction Clutches," because that is what it all amounts to; and then, when you realize that a tremendous waste is going on every day, try to realize how much bet-

ter that space would be used if those responsible for the bills had a better understanding and appreciation of its real value when put to its legitimate use—Salesmanship in Print.

If ever there was a time when every art and artifice known to man needed to be brought into play, that time is now and the coming years. Broadly speaking, publicity is capable of accomplishing anything. At least 90 per cent. of the engineering firms of any country can expand and extend. Those who will free their minds of prejudice and will realize what a tremendously powerful force can be wielded by paper and ink will find eventually, if they will have faith and be persistent, that modern advertising is the quickest and least costly method of securing business—if it is done on the right lines.

### THE FUTURE OF MUNITIONS FACTORIES

UNTIL such times as peace seems to be reasonably well in sight, the immediate purpose of shell factories will continue to be as heretofore, i.e., shells. When the end of the war is actually in sight the problem will become more or less acute, but just where readjustment will be most necessary is a question which will be influenced by something more than finding work for the machines. The various questions of factory location, lay-out, equipment, and plant, will all demand consideration, while the question of peace time shell contracts is a subject which also will have to be considered later. The following extract from the editorial columns of *The Engineer*, is of particular interest, coming as it does from a reliable source in close touch with existing conditions, and indicating the various factors which have influenced the design of Britain's shell shops, along with certain problems which will be encountered during the resumption of commercial work by the thousands of firms at present controlled by the Ministry of Munitions.

"It does not seem altogether improbable that, for the first two or three years at least after the return of peace, most of these factories will still be kept fairly busy, though not necessarily only on munition supply for ourselves, for it must be remembered that a considerable proportion of these factories in England are engaged on work for other countries, and that a considerable number of foreign orders are likely to be placed in England after the war by nations that have not been engaged in this struggle. It cannot altogether be expected that the present high rate of output per man or per woman will obtain, and we may reasonably anticipate a greatly reduced individual output from the worker, which will tend to give an almost automatic solution of some of the prospective diffi-

culties. Next, there will be a demand for an adequate reserve of ammunition, to be maintained throughout the Empire, so as to ensure no recurrence of the appalling danger in which we stood early in 1915. This will keep some of the factories busy, but as there will be so much less urgency in the production of munitions, night work and Sunday work, which alone will reduce the output by over 50 per cent., will probably be discontinued entirely. It seems probable, therefore, that in many cases it will not be necessary entirely to close down the munition plants, which were specially designed for shell making. Those plants, as, for instance, in the cases of the textile manufacturers or motor builders, which were adapted for shell making, will simply revert to their original business, and in these cases we may be sure that extensions which have been made for munitions will be readily welcomed for the increased output of the original product that will certainly be required.

#### Unsuitable Plants

In other cases, however, it seems probable that the shops built for shell making will prove unsuitable for general engineering purposes. They were laid down purely as shell shops, and in most cases the width of bay adopted is too narrow to admit of a convenient general engineering plant being installed. Moreover, many of the lighter shell shops are too low or too light in structural strength to admit of any but the smallest jib cranes being employed. Traveling cranes would be quite impossible. That they will suffice as small machine shops is true, but for that purpose their locality is sometimes against them. Where possible, therefore, it is to be supposed that these shops will be kept on shell work as long as orders are available and if the space they occupy is not urgently required for some more pressing work. The average width of a small shell shop bay might be taken as 25 ft., and of the larger shell bay, 30 ft. to 36 ft. In the latter case, for handling shells of 8-in. diameter and upwards, overhead cranes are a *sine qua non*, and are invariably fitted. These shops are of ample height and strength to carry them. Unlike so many other manufactured articles, a shell does not increase in bulk as it travels through the shop, and for calibres of 6 in. and less, when the shell can be easily handled, cranes are unnecessary except in the form of whips for facilitating handling in and out of the machines. Unfortunately it thus comes about that those shell factories which are most suitable for general engineering work after the war are precisely the heavier national factories, which appear most likely to be retained indefinitely in their present role.

#### Shell Making Too Specialized

When it comes to the question of ma-

chinery, one may safely say that the quantity of special shell machinery that will be available after the war will be enormous. Much of it will be virtually worn out. Still more will be practically useless for general engineering work, particularly in the case of small calibre shell lathes. So much machinery for shell manufacture had to be made in the least possible time in the early stages of the war that specially simple machines just big enough for the work were found to be most readily obtainable, and shell lathes are far from being general service lathes. Nor are rough boring machines for shell work, except in large sizes, capable of being readily applied to other work. The mass of small tools which have been erected for making machine guns, fuses, hand grenades, rifles, etc., is amazing, and when the demand for these products falls, as it must, to a fraction of the present output, it seems that there will inevitably be an enormous amount of small second-hand tools thrown on the market. It is probably not generally realized what quantities of special munition machinery have been made in the last eighteen months. One suggestion for the future disposal thereof we have heard mooted is the sale of complete plants to countries like Roumania or the South American Republics. No country in future can afford to be dependent on others for the supply of munitions. The means for their manufacture must be internal, and the colossal scale on which ammunition has been expended during the present war must cause small Powers serious misgivings as to the adequacy of their own stocks.

#### General Plants Least Affected

Generally speaking, shipyards and marine engineering works have not very greatly increased their plants, especially for war work, and it would appear that they are likely to find themselves as busy as they can be for some years. Those which have, however, will find no difficulty in making use of the developments in shop space. When the inevitable settling down does take place after the war, we shall expect to see a very great demand for steel. It is possibly in this direction that our biggest development will take their place. At the present time, especially in view of the quantities of steel being absorbed for munition work, we might almost be inclined to suggest that our machine shop capacity is far in advance of our ability to produce steel. Steel works development, however, is an extremely lengthy and costly business, and necessitates plant of the heaviest type, and it must not be overlooked that widespread and great as have been the munition extensions, they are mostly light shops with the simplest plant, and have, therefore, been relatively easy to erect and start working. When it is remembered that

our engineering export trade has been enormously curtailed in the last two years, and that to supply our own requirements after the war in the shape of the accumulated leeway in almost every section of the engineering trade—locomotives, rolling stock, looms, ships, and engines, and the vast mass of miscellaneous work—will involve a tremendous amount of work, it seems almost a pity that some of these national factories could not have been laid down with a view to conversion into general engineering works on the conclusion of peace. At the time, however, it was of such urgent necessity to make sufficient shells to win the war that such a point may reasonably have been ignored."

### LUMBER TRADE

THE Department of Trade and Commerce is calling a conference of Canadian lumbermen to concert measures for taking advantage of the great market for lumber in European countries consequent upon the reconstruction demands after the war. The Department has in course of completion a report on trade openings for Canadian lumber in Europe as investigated by H. R. Macmillan, Chief Forester of British Columbia.

It is pointed out that every one of the belligerent nations will require immense supplies of lumber as soon as rebuilding starts. In Belgium, forests have been entirely destroyed. In Northern France, thousands of new homes will have to be built, and railway rebuilding will require an immense quantity of railway ties.

In England and Scotland forests have been denuded, the supply of lumber already exhausted, and imported lumber is in urgent demand. In Italy the same condition applies. Russia still has great supplies of standing timber, but it is said to be unsuited for rebuilding operations owing to its lower quality.

In the United States lumbermen have already under way several export associations with foreign sales agencies to secure and distribute orders for American lumber. Sir George Foster wants a similar organization of Canadian lumbermen to secure European business for Canada.

### RAILWAY JOINT TARIFFS

THE Railway Commission has made an Order disallowing all notices of cancellation of joint freight tariffs which have not been superseded by other joint freight tariffs duly filed with the Board and applicable between the same points and to the same classes of traffic.

The Order is the result of a report made to the Board by its chief traffic officer that the C. P. R. and G. T. R. have been cancelling joint tariffs with-

out submitting new ones as required by law, and that this was being done only in so far as connections with the Canadian Northern were concerned. In like manner the C. N. R. has cancelled joint tariffs applicable to points on the other lines. The new Order exempts such cancellations as are justified by the constructions of new lines or otherwise.

### REVERSIBLE LUBRICANT PUMP FOR MACHINE TOOLS

THE use of cutting compounds has become such a recognised feature of metal cutting operations that increased attention is being given to lubricant pumps

REVERSIBLE PUMP FOR CUTTING COMPOUND.

for machine tools. Various devices have been developed for overcoming the necessity of a separate belt drive to the pump which is necessary where the machine spindle is subject to reversal, and a reversible pump which delivers continuously in one direction while being driven in either direction forms the subject of a recently issued English patent. It has been specially designed for direct drive on machines which have reversible motion, and as shown in sketch, it accomplishes its object through the medium of a free ball Q which seats itself on either of the ports O and P according to the direction of rotation. By placing the inlet port J diametrically opposite, a suction effect is created behind the flow of liquid through one of the discharge ports and seats the ball accordingly. By using suitable material for the ball, the possibility of it settling at the bottom is overcome. The remainder of the pump construction is amply apparent from the illustration.

### READERS' QUERIES

**Question.**—Can you give me a recipe or furnish me with information as to how tools are mottled, such as Brown & Sharpe, or Starrett tools.—H.E.

**Answer.**—The mottled finish on drop-forged steel tools is produced by case hardening in bonedust. This is a long, slow process of several hours, and requires a quantity of bonedust, a good-sized receptacle, and fire-clay. Practically the same thing can be obtained without these, although the case hard-

ening will not run so deep. Put enough potassium cyanide in an iron receptacle of suitable size and heat until red-hot. Dip the articles mottled into the molten cyanide and leave a few minutes long enough to be brought thoroughly up to the red heat and a little longer; then take out and quench in clear, cold water, and you will have a fairly mottled surface.

The mottled finish may be imparted to steel surfaces by a mechanical method also. To the end of a short, round piece of steel fasten a disc of leather  $\frac{1}{8}$  inch thick by means of steel pins inserted in the end of a steel piece; the pins must protrude through only far enough to hold the leather, and not penetrate through. Place the steel piece in a drill chuck and apply a small quantity of fine emery and a little oil to the surface of the leather. Hold the tool against the leather while the tool revolves. Various effects may be obtained by moving the article being finished into different positions while holding it against the leather. Different sizes of circles or spots will require different sizes of leather and shank. When used in a universal milling machine, the mottled effect can be greatly diversified, and many graduations of the circles may be employed to good advantage.

\* \* \*

**Question.**—Owing to existing conditions, a staff of men are given a 25 per cent. increase, with the stipulation that a similar cut will be made at the end of six months, if circumstances warrant it. If the wage before the increase was \$20 per week, what would be the rate after the proposed cut?—C.M.

**Answer.**—If the amount of the increase were to be deducted at the end of the period, the rate of pay would be the same as before the advance; but on a percentage basis, the rate after the advance would be  $\$20 \times 1.25$  equals \$25, and a 25 per cent. cut on this amount would represent a decrease of  $\$25 \times .25$  equals \$6.25; therefore, the rate of pay after the cut would be only \$18.75.

\* \* \*

**Question.**—At a maximum speed of 80 feet per second for cast iron, what would be the largest diameter of fly-wheel that could be used to obtain 300 revolutions per minute?—P.H.

**Answer.**—A speed of 80 feet per second is equal to  $80 \times 60$ , equal to 4,800 feet per minute; therefore the circumference of the wheel would be the space passed through per minute, divided by the number of revolutions, or 4,800 divided by 300 equals 16 feet; and the diameter would be the circumference divided by 3.1416, or 16 divided by 3.1416 equals 5.09 feet, or approximately 5 feet in diameter.

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## SPECIAL MACHINE FOR MARKING FUSE CAPS

A SPECIAL marking machine for graduating and numbering bevel fuse caps in one operation has just been put on the market by the Noble & Westbrook Mfg. Co., of Hartford, Conn., fully equipped with graduating dies ready for the operator to start work. This is an addition to their well-known Dwight slate marking machines. As illustrated herewith, the

The machine is suitable to graduate not only fuse caps but any bevel surface such as micrometer collars on lathes, milling machines or any machine

## ROTARY PUMPS FOR BY-PRODUCT PLANTS

THE pumps described are used to circulate the wash oil, which sometimes is

termed straw oil due to its color, through the scrubbing equipment of by-product plants. The oil is pumped in at the top of these scrubbers, and as it passes down through the apparatus, it absorbs the by-products, such as benzol, tuluol, zyols, phenol and other hydro carbons. The oil laden with the substances which have been absorbed from the gas, passes into a large tank or

FIG. 1. GENERAL INTERIOR ARRANGEMENT.

using graduated collars. It can also be used to put on lettering in place of graduations on bevel surface, and is claimed to give excellent results. The saving of time and labor by using a machine of this nature is easily appreciable, as with one turn of the hand lever a complete mark is made and dependence can be placed on each succeeding mark being accurate and uniform.

sump from which it is taken to apparatus which removes the products picked up while passing through the scrubbers, that is the benzol, tuluol, etc. After these have been removed, the oil is returned to the system and pumped through the apparatus again. The quantity of oil to be handled varies from 4,000 to about 40,000 gallons per hour, and the discharge head runs as high as 150 feet, but is usually around 125 feet. In some cases the discharge head has been as low as 50 feet. In some installations the oil flows by gravity to the ends of the pump while in others, the suction lift runs as high as 8 ft. but it is usually around 5 ft. The wash oil or straw oil is handled at a temperature of about 120 degs. C.

The operating principle of those rotary pumps is remarkable for its simplicity. The moving parts consist of two parallel shafts with an impeller on each and having a gear keyed on the

FUSE CAP MARKING MACHINE.

new unit is simple in construction, accurate and easy to operate.

The graduating die is held in a holder keyed to shaft, the shaft, as mark is made, revolves with the die, winding a spring tension which as soon as contact with work is broken returns work holder to its proper position to mark the next piece. The shaft runs in bronze bearings with collar adjustment. The work is held in place with relation to die by accurately cut gears; and depth of impression is provided by foot pressure through a lever and cam which is adjustable so that it is possible to regulate the depth of impression to an hundredth part of an inch. This means that even and accurate impressions can be secured.

FIG. 2. ROTARY PUMP FOR CIRCULATING WASH OIL.

ends. They are assembled to 90 degs. one to the other and this relation is permanently maintained by means of the above mentioned gears. Fig. 1 shows a section through the pump. The impellers rotate in opposite directions, one clockwise, the other counterclockwise. The water from the suction pipe is enclosed between the impeller (as shown in vertical position), and the case, so that for an instant there is a body of water which is not open to either the suction or discharge sides. As the impeller continues to rotate, it immediately opens to the discharge side and the volume which was enclosed is forced into the discharge side. Since, owing to the shape of the impellers, there is at no time a possible return between the shafts, it is evident that a quantity of water equal to the enclosed volume is discharged at every half revolution of each impeller. For each revolution of the pump, therefore, four times this volume is discharged.

#### Pump Case

The case is composed of two identical semi-circular castings and two identical headplates, all substantially ribbed to eliminate deflection. Suction air chambers are cast in the lower part of the case. The bearings are approximately three times the diameter of the shaft which, since the shaft is of ample proportions, gives a very low bearing pressure. This together with effective oiling maintained by oil chains or rings reduces wear to a minimum. Since practically all of the wear occurs vertically, the single wedge beneath the lower half box permits adjustment at any time, if necessary, while the pump is in operation. In the pumps of large capacity, the expense of a quarter box bearing is justified owing to the greater nicety of adjustment thus made possible, besides being of course necessary. The oil reservoirs beneath the bearings are of generous proportions, permitting continuous operation without attention. The main bearings are cast integral with the headplates, resulting in a quite compact and rigid design.

In the production of the gears, we understand that a special cutter is used for each size. The exceptionally wide face, about seven times the circular pitch, gives long life with a minimum wear. The involute tooth is used. For material, semi-steel has been found to have excellent wearing qualities. The pump is self contained on a deep, well-ribbed bedplate, and each pump is shipped ready to be grouted into position. Local conditions and the purchaser's preference generally govern the choice of the drive. As these ma-

chines have their most common application for pumping water and non-corrosive liquids, cast iron and steel are commonly used, but in case the liquid to be handled is corrosive, suitable resisting metal is selected.

Designs have been gotten out for three ranges of pressures:—Low lift pumps for heads from 0 to 30 feet; medium lift pumps for heads from 30 to 80 feet, and high lift pumps for heads from 80 to 200 feet. The capacities vary from a displacement of 1-10 of a gallon per revolution up to 50,000 gallons per minute, the applications of the pumps being universal within the capacities and heads given above. Besides irrigation projects, reservoirs, condensers, cooling towers, and circulating systems, we understand that this type pump has become a feature in by-

NEW BALL TYPE THRUST BEARING.

product coke oven service for handling wash oil, tar and ammoniacal liquor. Of primary consideration are the facts that it is a positive displacement pump and that it is valveless, thus combining merits of both the centrifugal and reciprocating pump. Priming is never necessary for starting, and the delivery is constant and independent of the head. The efficiencies claimed are noteworthy, varying from 75 to 85 per cent. of the power applied to the pump shaft. Low first cost, small repair and small maintenance charges, small floor space and long life, constitute claims made on behalf of this specialty. The P. H. and M. F. Roots Co., Commersville, Ind., are designers and manufacturers of these Rotary Pumps for by-products plants.

Don't guess at measurements when installing machinery.

#### BALL THRUST BEARINGS

THE Rochester Ball Bearing Co., Inc., of Rochester, N.Y., has introduced a line of ball thrust bearings which, while they do not incorporate any radical departure from generally accepted good practice in this line of manufacture, embody a number of interesting features. Of special merit in these bearings is the solid brass retainer. Experience has shown that a large proportion of ball thrust bearing failures are traceable to the use of sheet metal retainers, which wear rapidly, allowing particles of steel to fall into the races. The shock and extra wear, due to the balls running over these particles, eventually ruins the bearing. This, it is claimed, cannot happen with solid brass retainers. These bearings are usually made with round grooves, although V groove bearings are regularly made for high speed, light duty conditions, special bearings being, in addition, made to order. Thrust bearings for heavy duty are made with self-aligning spherical seat washers. The illustration shows medium weight bearings of large size. The retainers of small bearings are not scalloped.

#### UNIVERSAL ROUGHING MACHINE FOR BEVEL PINIONS

A UNIVERSAL machine for roughing either right or left-hand bevel pinions preliminary to finishing on a standard spiral type bevel gear generating machine is a recently developed product of the Gleason Works, Roches-

UNIVERSAL ROUGHING MACHINE FOR BEVEL PINIONS.

ter, N.Y. While the builder's standard spiral type bevel gear generating machines will either rough or finish the pinions, it is possible by using the new machine to perform the roughing operation cheaper and faster. The cutter operates at a speed of 130 ft. per minute and one tooth can be cut in as short a time as 19 seconds.

The machine is entirely automatic and will rough either right or left-hand spirals. The generating roll of the work spindle actuates a positive indexing mechanism, and, for spacing teeth, a notched dial with the required number of divi-

sions is employed. The feed, which is of the positive type, is driven by a cam mounted directly on the cutter sleeve. The machine is driven from the countershaft by a belt. The driving pinion for the internal gear drive to the cutter is mounted on this shaft, and all the other drives, including that for the pump, are taken from it. The cutters and the mandrels used are of the same type as those employed on the finishing machine and, of course, are interchangeable. The adjustments for setting to the spiral angle can be easily and quickly made. The cutter is permanently set to the root angle and, as pointed out, requires adjustment only as it wears, or a new cutter is required. All parts are easily accessible and can be readily oiled and adjusted. The attachments furnished include one index dial, a set of feed change gears, a cutter gauge, an oil pump and connections, a set of wrenches and a countershaft.

Another advantage of the Duplex Ex-

EXCITER UNIT WITH DUPLEX DRIVE.

citer Drive is that it gives the exciter unit a higher all-day efficiency than either a motor-driven or a steam-driven exciter. This maximum efficiency is secured by driving the unit from the turbine end when the station is operating at full load and the turbine exhaust can be used efficiently in the heaters, and by shifting the drive to the motor end when the station load is light, and the main generators can easily carry the exciter load. The turbines were manufactured and the units assembled by the Terry Steam Turbine Co., Hartford, Conn.

Each unit consists of a 300 k.w. exciter direct-connected to an induction motor at one end and to a steam turbine at the other end. The governing mechanism of the turbine is so arranged that

#### EXCITER UNIT WITH DUPLEX DRIVE

THE exciter unit shown in the accompanying illustration is one of a number now being installed in the new power plant of the Buffalo General Electric Co. These sets are of large capacity—300 k.w. normal—and are provided with two independent sources of power for driving each exciter.

Each unit consists of a 300 k.w. exciter direct-connected to an induction motor at one end and to a steam turbine at the other end. The governing mechanism of the turbine is so arranged that

**A FRENCH SCREW GAUGE**  
THE order recently made by the French Minister for War, enforcing the adoption of the S.I. screw thread, directs attention to the "instructions" on the nature and measurement of this thread which were circulated amongst French manufacturers in 1913. In these instructions a description is given of a simple

FRENCH SCREW GAUGE.

form of screw gauge devised by M. Marre, which was published in a recent issue of *The Engineer*.

The principal feature of interest is the use of a species of handvise known as a "crocodile," which is used in conjunction with a high and low limit indicating gauge. The gauge proper is the "crocodile" shown in the annexed sketch. The hole in the jaws is tapped to fit a standard screw. It is obvious that any screw which fits the jaws approximately, but is yet incorrect in pitch or diameter, will either cause movement of the jaws or will jam when screwed in. The extremities of the jaws are cut away as shown, and the section of the thread, which is thus made, when engaged with a screw presented to the jaws shows roughly the nature of any obvious defects. A master screw being put in the jaws, the crocodile is placed on the anvil G, and the screw I is brought down till delicate contact is made. The surfaces M and N of the crocodile jaws are truly cylindrical. The micrometer screw can be turned back to give the maximum reading. A similar adjustment, but for minimum diameter, is made with the screw J. Further explanation is unnecessary. Any screw that is too small will allow the crocodile to pass the "not-go" gauge; any screw that is too large or defective in pitch, etc., will not revolve in the hole, and will open the jaws so that they will not pass the "go" gauge.

#### TRYING TO CONSERVE NIAGARA'S POWER

THE Minister of Inland Revenue is arranging to meet the various interests concerned in the Niagara power situation some day this week. The Federal authority has been invoked as a means of aiding in the movement to conserve the power developed at the Canadian Falls for use in Ontario through the Ontario Hydro-Electric Power Commission. The companies which are exporting power from the Canadian side into the State of New York are being urged to turn this power or part of it back into Ontario for use by the Hydro. It is urged, on the other hand, that the power exported is being delivered to consumers in the United States under contract. The export is done under license issued by the Inland Revenue Department, and it is to this department that the parties are now appealing.

**Scotticism.**—McTavish and Macpherson are adrift at sea in an open boat. McTavish (on his knees)—"O Lord, I ken I've broken maist o' Thy commandments, and I've been a hard drinker all my days; but, O Lord, if we're spared this time, I promise never ——" Macpherson—"I widna commit mysel' ower far, Donald. I think I see land."

### CANADIAN SHIPBUILDING FOR EXPORT

**A** NENT the recently passed Order-in-Council at Ottawa, whereby a 99 per cent. drawback becomes effective on material imported for shipbuilding purposes in Canada, some difference of opinion appears to exist as to its all-round value to the industry here. The first clause of the Order-in-Council is that on which the question altogether hinges; we quote it as follows:

A drawback not exceeding 99% (ninety-nine per cent.) of the Customs duty paid, may be granted and paid by the Minister of Customs on materials used in the original construction of ships and vessels measuring over five hundred tons gross tonnage, built in Canada, when such ships or vessels are authorized by Order-in-Council to be exported for Registry outside of Canada or are British Registered in Canada and are constructed so as to obtain a class in Lloyds, Bureau Veritas, British Corporation or other recognized classification satisfactory to the Minister of Customs; provided that the drawback payable under this section shall be in lieu of any drawback based on a specific rate per registered ton.

It is expressly stated in the foregoing that the drawback is only effective when vessels built here are authorized by Order-in-Council for export to registry outside Canada or for British registry in Canada. No concession is made with respect to Canadian built vessels to Canadian registry and as a consequence what has been promulgated savors of a hardship in the estimation of some. On the face of it, there does not, of course, appear any good reason why the Order-in-Council should not have been made all-inclusive in its application, yet "half a loaf is better than no bread," and as under present circumstances, the biggest half loaf is our shipbuilder's portion, it may not be in order to find fault to any great extent. The major portion of the vessel contracts under performance by our various shipbuilding plants are for registry other than Canadian, and for several years to come a like condition is certain to prevail.

Shipbuilding—wood and steel is booming in Canada as never before, ample evidence in itself that the recent Order-in-Council has accentuated rather than deterred the degree of activity. As bearing out this opinion we understand that the Shipping Federation of Canada—a body representative of our principal vessel owners, expresses the view that the drawback effect cannot fail to induce

greater shipbuilding activity on our lake and ocean shores. In any case, the step taken by the authorities at Ottawa is in the right direction—aid to native shipbuilding, even although of outside registry, and bearing in mind the fact that the aid has been forthcoming at an opportune time to make it of helpful effect, there is little doubt but that the little remaining disability concerning Canadian built vessels for Canadian registry will disappear when conditions warrant.

It has been quite general practice to have our canal size lake-boats built in Great Britain in years past as also many of our coasting vessels, the difference in cost of construction materially favoring such procedure. Because of the world-wide shortage of "bottoms" for ocean services, due to the almost complete cessation of new construction in Great Britain for many months; the normal and war losses; the fact that the shipyards there will be taxed to the limit of capacity output for well-nigh the next decade; and that comparative costs as between Canada and the Old Country will have drawn more nearly level following the war, a lessened construction abroad of vessels to Canadian registry will result, with a corresponding increase in the home built product and like registry. As world output begins to overtake arrears and a slackening of the demand for Canadian built ships of outside registry becomes imminent, we look to see the drawback made applicable to all our vessel construction.

### THE N.T.R. SHOPS AT ST. MALO

**L** EST we forget. The National Transcontinental Railway shops erected and partly equipped at St. Malo, Que., are still lifeless. What is perhaps still worse, they are rapidly approaching the wreck and ruin stage. A nesting place for sparrows is the most recent version of their meantime condition, from which perhaps other and still more interesting conclusions can be drawn. Whether these particular shops should ever have been built is beside the question at the moment, but having got to the near stage of completion evidenced a few years ago, steps should have been taken to give the finishing touches to the undertaking. The war, so far as they were concerned, through the demand made upon us to supply shells, should have stimulated instead of retarded action. Political party strife, and that alone, is responsible for the productive inactivity and hopeless ruin of the St. Malo shops in which several million dollars have been sunk for buildings, plant and equipment.

What surprises us, however, is that the Imperial Munitions Board, now almost a year in existence, did not take up the utilization of this going-derelict plant and wrest it from the political lions. The record of the Board during the past year has been a good one, in spite of the fact that in the view of many, ourselves included, more or less arbitrary methods have been on occasion employed. With respect to the St. Malo shops, we should have thought that with the Letters Patent of the Imperial Government and the high-grade executive personnel of its members, it should have been possible for the Munitions Board to not only arrest the destruction of these shops but to have turned them to good account as a representative national munitions factory. It may not be too late yet for action. In any case, the St. Malo shops will be wanted one day—we are led to this conclusion because of the tremendous industrial development that is so generously prescribed for our Dominion following the war. In anticipation, wouldn't it then be wise to set about the work of reclamation, while there still remains a percentage worth while of what has been spent?

## INDUSTRIAL NOTABILITIES

**R**ALPH BERGEN HAMILTON, M.E., president and general manager, The Packard Electric Co., St. Catharines; director, Reo Motor Car Co. of Canada; director, Precision Mfg. Co., St. Catharines, was born at Toledo, O., April 11, 1875, son of John Allen and Harriet Hale (Rowland) Hamilton. He was educated at the Public School, Saginaw, Mich.; The Dresden Polytechnik, Germany; Cornell University (M.E., 1896), and began his business career as a draughtsman with the Buffalo Engineering Co., Buffalo, N.Y., in 1896. He was assistant engineer, Howard Iron Works, Buffalo, 1897-1898; assistant manager, Iroquois Iron Works, Buffalo, 1899-1900; acting manager, Packard Electric Co., St. Catharines, 1901; became secretary-treasurer and general manager, 1901-1912, and was appointed president and general manager, 1912.

RALPH BERGEN HAMILTON, M.E.

Mr. Hamilton is an ex-director, Rochester *Times* Publishing Co., and of the McMillan Springs Co.; president, St. Catharines Board of Trade, 1906-1907; member of Finance Committee, Patriotic League; chairman, Manufacturers' Committee, Recruiting League; ex-member, Executive Board, Canadian Manufacturers' Association; and was appointed by the Imperial Munitions Board, special representative on investigations pertaining to the manufacture of munitions.

He married Edith Raphael Seixas, daughter of Gersham A. Seixas, New York City, 1899; has three sons. His clubs are: St. Catharines Golf; National (Toronto); University (Buffalo); Alpha Delta Phi (New York); Engineers' (Montreal); Little Saguenay Fish and Game; and his societies: the American Society of Mechanical Engineers; Associate Member, American Institute of Electrical Engineers. His residence is 30 Bellevue Ave., St. Catharines, Ont.

Prices Per Lb. Unless Otherwise Stated.

being \$7 per ton. Foundry coke at \$10 is 50c per ton higher than last week. The exceptional demand for billets and sheet bars is maintaining this market in a very strong position, and a higher price tendency is evident. The inquiry for all kinds of plates is very heavy, but producers are not in a position to supply the trade for delivery under six or eight months. A recent advance of \$3 per ton has put Pittsburg refined bars on a basis of \$3 per hundred, while steel bars are quoted at \$2.90. Structural shapes are now \$3 Pittsburg, following an advance of \$3 per ton. Steel rails are active, more especially the lighter sizes. Recent heavy demand has resulted in a shortage in sheets and prices are higher; black sheets are now quoted at \$4.50 Pittsburg; tin mill black is also \$4.50, an advance over the week of 50c a hundred. Blue annealed sheets are now \$3.60 Pittsburg, and galvanized sheets \$6; the general advance on all sheets being about 50c a hundred. Recent developments are beginning to tell on wire and wire products, and with the continued demand higher prices are expected. For early delivery on wire rods price is a secondary consideration. Nuts, bolts and rivets are from \$3 to \$5 higher, due to the higher cost of raw material. Wrought iron pipe and boiler tubes are still very active. The local steel situation continues very strong, with higher quotations pending; the advances this week are confined to sheets. No. 28 black being now \$4.50; No. 10 black, \$5.50; Apollo, 10¾ oz., galvanized, \$6.95; Premier No. 28, \$6.50; and 10¾ oz., \$6.80.

**High-speed Steel**

The situation in high-speed steel continues very good; the demand is not quite so heavy and the volume of steel used is lighter owing to more efficient methods of using the steel. Producers are still working to capacity filling trade requirements, but conditions are becoming easier. Prices are still well maintained.

**Metals**

The outstanding feature of the metal situation is the phenomenal advance in copper, which is at present overshadowing all other developments. Tin is strong, and quite active. Spelter is in good demand on higher prices. Lead is firm, with stronger tendency. Antimony is also firmer, and aluminum is unchanged.

**Copper.**—The scarcity of available metal is still pronounced, and it is reported that copper contracted for several months ago at 25½¢ is being sold to-day at current prices, which would indicate a maintenance of existing quotations. European reports show a decline of stock on hand and London quotations are firmer. New York prices have again advanced 1½¢ on lake, 1¢ on electrolytic, and 2½¢ on castings; the present nominal quotations being 34¢ for lake and electro, and 32½¢ for castings. The local

## The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents

Montreal, Que., Nov. 27, 1916.—The industrial situation is still featured by the unceasing demand for all kinds of product and advancing prices. The continued increase in production is not sufficient to supply trade requirements, and consumers in many instances are forced to wait the pleasure of the producer. The situation is also becoming more affected by car shortage, which, with the near approach of heavy weather and the close of navigation, may have a serious result on early market conditions.

**Pig Iron**

The upward movement in pig iron still continues, and further advances are reported. The fact that ore producers

have advanced the price of various ores would indicate that the market value of pig iron has not yet attained a maximum. Pittsburg quotes Bessemer pig at \$30.95, an advance of \$1 per ton.

**Steel**

Remarkable activity continues to feature the general steel situation, and prices are still soaring. Quoted prices are only a guide to what is being paid by the average purchaser. If the metal was available for early delivery it is believed that almost any price could be received by the mills. The higher cost of furnace operation is one of the main factors in present advances, as spot coke has advanced another \$1, the current quotation

situation is active, with prices very strong, dealers here having advanced their quotations 3c during the week; lake and electrolytic being now 37c and castings 36c per pound.

**Tin.**—The market is developing strength, and prices are advancing, the U. S. situation being affected by the inability to secure sufficient tin for present requirements, due to the fact that shipping permits are being withheld. London prices have advanced, and New York is quoting  $\frac{1}{2}$ c higher than a week ago. Dealers here, report a strong market with prices firm and unchanged.

**Spelter.**—Gradual improvement is maintained in spelter, and the increasing demand, together with a steady return to higher levels, seems to indicate a better market. The brass mills are active buyers, and with the feeling that much of the recent buying of copper has been made by these interests, further activity is expected in spelter. Slight advances have been made in London quotations, and New York prices are  $\frac{3}{4}$ c higher, prompt being quoted at 12.92c per lb. Prices here are firm on a steady market.

**Lead.**—The market is very steady, with an undertone of additional strength. While the Trust is inclined to hold to its recent quotation of 7c, outside interests are asking  $7\frac{1}{4}$ c.

The local market is active, and prices have advanced, dealers quoting  $9\frac{1}{2}$ c, an advance of  $\frac{1}{2}$ c per lb.

**Antimony.**—Owing to a slight increase in demand, the market is stronger, with prices advancing. New York has advanced  $1\frac{1}{4}$ c during the week, the present quotation being  $14\frac{1}{2}$ c per lb.

**Aluminum.**—No change is reported, and quotation of 70c is very firm.

#### Machine Tools and Supplies

The changes recently effected in the make of some of the smaller-sized shells has developed increased activity in many of the smaller tools. While the general demand is not heavy, sufficient business is passing to keep machine tool makers very busy, and in some instances delivery is still backward. Present additions to existing plants and those under consideration, both for munitions and domestic purposes, will require further equipment, assuring continued activity in this direction. Higher prices are general owing to the situation in steel and metal markets. All supplies are in good demand, with prices showing higher tendency.

#### Scrap

Higher prices prevail, and the market is generally stronger. Heavy buying in heavy melting steel is one of the features of a very active market. Borings and turnings are in good demand, and dealers' prices have advanced. Local conditions are reflecting the trend of the market, and dealers report an active situation, old copper being the feature,

$2\frac{1}{2}$ c being the advance on all grades; light quoted at 23c, and crucible, heavy and wire going at 27c. No. 1 machine composition shows a similar advance, the current price being 21c. Composition turnings and brass clippings are now 17c, an advance of 2c. Brass turnings at  $15\frac{1}{2}$ c are  $2\frac{1}{2}$ c higher. Heavy melting steel is  $\frac{1}{2}$ c stronger at 12c per lb. Stove plate is  $1\frac{3}{4}$ c higher, being quoted at 12c. Lead is stronger, heavy being quoted at  $7\frac{1}{2}$ c and tea lead 6c per lb. Scrap zinc at 8c is an advance of  $\frac{1}{2}$ c per lb.

**Toronto, Ont., Nov. 28.**—Reports from the United States to the effect that the British Government is cancelling contracts for rifles have been denied in some quarters. There is, however, reason to believe that there may be some truth in these reports, as the Government has already inaugurated a policy of having all war equipment and munitions made, as far as possible, in the Empire. Such a policy will naturally be of the greatest benefit to Canada, and manufacturers and munition makers are thus assured of practically all the business that they can take care of for the duration of the war.

#### Steel

The situation in the steel trade is best illustrated by a recent announcement that the output of the Algoma Steel Corporation was sold out for 1917; this also applies to the three other important steel producing concerns in Canada. The Algoma Steel Co. had on Oct. 31 unfilled orders amounting to approximately 380,000 tons, consisting principally of shell steel and steel rails. The logical result of such a situation will be that prices will continue to advance until supply and demand are more equally balanced. The time when this is likely to happen is not yet in sight, for the demand appears to grow heavier in greater proportion than the increase in capacity of the mills. Another factor tending to further enhance steel prices is the more or less recent but rapid advance in pig iron. Prices of wrought pipe are very firm, following the advance noted last week, and higher prices are looked for before the first of the year. Another advance in boiler tubes has been made, which will be followed in the near future by a further advance. The tube mills are sold out for eight to ten months, and consumers continue to specify freely. The demand for plates, particularly from shipyards, is exceedingly heavy, and prices are consequently very high. The Carnegie Steel Co. has advanced its price on steel plates \$5 a ton, making \$3.50 per pound for shipment at mill convenience.

A serious scarcity of sheet bars has developed, which is threatening to tie up the sheet mills; a decided shortage in the supply of black, blue annealed, and galvanized sheets already exists. The

American Sheet & Tin Plate Co. has advanced its prices on black sheets \$7 a ton. Local quotations are also higher, black sheets, No. 28 gauge, being now quoted at \$4.50. Galvanized sheets have also advanced, Premier No. 28, U.S., being quoted at \$6.75, and Premier,  $10\frac{3}{4}$  oz., \$7 per 100 lbs. The local market is very firm.

In the U. S. the scarcity of steel is more pronounced than at any previous time, and buyers are exerting more pressure than ever on sellers to hasten shipments. Buying of all kinds of steel continues heavy, but the mills are unable to accept a large amount of the business offering. Tremendous orders have been placed recently by the Allied Governments for blooms and bars for shell steel manufacture, delivery to be over the last six months of 1917. Prices continue to advance, but they are more or less nominal. Steel bars are now quoted at 2.95c and shapes 3c, Pittsburgh, shipment at mill convenience. Forging billets are higher at \$78, wire rods at \$65 per ton Pittsburgh; Bessemer billets, open-hearth billets, and sheet bars, \$52.50 a ton Pittsburgh.

#### Pig Iron

Lake Superior iron ore has advanced \$1.50 per ton over the prices current for 1916. Pig iron prices continue very firm, and the situation is generally unchanged. Prices of domestic pig irons have not advanced during the week, but will no doubt do so at an early date. Prices of American brands of pig iron are still climbing, a few being quoted as follows:—Grey forge Pittsburgh, \$26.95; Basic, Valley furnace, \$25.50; Bessemer, Pittsburgh, \$30.95; Lake Superior charcoal, Chicago, \$26.75; and standard low phosphorus, Philadelphia, \$47 per ton. Hamilton and Victoria are quoted at \$32 per ton.

#### Scrap

The market for scrap metals is more active and the situation has improved; old copper of all kinds is higher, ranging from  $1\frac{1}{2}$ c to 2c above last week's prices. Machine composition and turnings are up, as are also brass clippings and turnings. Heavy and tea lead and zinc have advanced  $\frac{1}{4}$ c per pound, while old aluminum is also higher. Steel turnings are in better demand, with a broader market; accumulated stocks are being disposed of steadily.

#### Machine Tools

Considerable activity still exists in the machine tool market, due to the steady demand for equipment for munition plants. A number of inquiries have been received this week by local machinery houses for machine tools for making fuse parts, and also for the new style 4.5-in. and 6-in. shells. The demand for heavy single purpose lathes is not quite so active, although some orders

have been placed, mostly for single tools. It is understood that a prominent firm in the U. S. has advanced its quotations on all sizes of lathes from 12 in. to 24 in. by approximately 12½ per cent., and the new quotations are higher by that amount than the general level now prevailing. It is considered likely that other lathe makers will follow suit.

### Supplies

There have been no important developments during the week in this market. Business continues remarkably good, notwithstanding the high level of prices. Another advance in cotton waste is expected about the middle of December, while higher prices on rope may also be looked for. Copper wire is higher, and iron rivets are now quoted at 32½ per cent. discount, as against 35 per cent. formerly.

### Metals

Copper continues to be the leading feature of the metal markets, and there is likely to be a scarcity of this metal next year. Lead and spelter are showing greater activity, the latter having advanced slightly, while higher prices for lead appear probable. Tin continues firm, but unchanged, while antimony and aluminum are also in better demand. The situation for all metals looks brighter, and all prices show a firmer tendency. Business locally continues brisk, and the outlook is favorable for the future.

**Copper.**—The market continues strong and quotations have advanced locally, although the primary market is unchanged. As nearly all of the production of many companies, which they are willing to sell in advance, has been disposed of until the third quarter of 1917. It is believed probable that prices will go far above the present level. Every effort is being made to increase the output of the metal, but unless some of the companies now in the prospect stage find large amounts of the metal, it is considered improbable that the output will be large enough to take care of any but the most urgent buyers next year, outside, of course, of those who have already contracted for their needs. Prices have advanced 2c locally, electrolytic and lake copper being quoted at 36c, and castings at 35c per pound.

**Tin.**—The market is firm and steady. The New York market continues firm, due to a shrinkage in stocks and an active demand, while the amount of tin coming in has decreased. The situation in the tin market is such that higher prices may be looked for. Local quotations are unchanged at 48c per pound.

**Spelter.**—The demand for this metal continues more active, particularly for brass special spelter, and the market is holding firm, with quotations up ½c per pound. Local price, 14½c per pound.

**Lead.**—While the "Trust" is holding

the price of lead at 7c New York, independent producers have raised their quotations to 7.20c New York for spot metal. Local quotations firm and unchanged at 9c per pound.

**Antimony.**—There has recently been a more active demand for antimony and the market is firm. Local price, 18c per pound.

**Aluminum.**—The market is firmer, due to an improved demand and a scarcity of spot and nearby metal. Aluminum is quoted locally at 68c per pound.

### LAKE SUPERIOR CORPORATION

It was recently announced that the Lake Superior Corporation would issue periodical statements to its shareholders. The first of these announces that "for four months ended October 31 there were produced 131,600 tons of ingots, and 82,500 tons of finished material. Production has not quite come up to expectations, due to labor difficulties generally. Conditions, however, are improving, and the results for the last few weeks have been more satisfactory.

"The output is practically sold up for the ensuing year. At October 31, the Steel Company had approximately 380,000 tons unfilled orders on hand, the tonnage preponderating being shell steel and steel rails. Prices are satisfactory, but profits on war material cannot be as high as in the States from the fact that heavy duties plus war taxes are payable in Canada, and in addition it must be kept in mind that the price of steel rails has increased but slightly in comparison with other steel products.

### New Construction

"Some delay is being experienced in the completion of the two new 75-ton open-hearth furnaces, but, as far as can be seen, those furnaces will be completed by the end of the year, and with their completion the steel plant should be able to produce about 45,000 tons of ingots monthly. The end of the year should also see the finish of the more important construction work. On account of labor conditions, it is doubtful if, beyond a third 75-ton open-hearth furnace, any attempt will be made to embark upon further new construction; the most formidable of which yet to be undertaken is, of course, the development of the mills.

"The subsidiary companies of the Algoma Steel Corporation, namely, the Cannelton Coal and Coke Co., the Lake Superior Coal Co., and the Fiborn Limestone Co., are generally operating satisfactorily. The coal companies are handicapped through car shortage and their output and earnings will be somewhat affected." It is pointed out that the Fiborn Limestone Co. recently acquired the Ozark Dolomite Quarries containing large quantities of high-grade dolomite suitable for steel plant operations.

### NEW G. T. R. SHOPS AT PORT HURON, MICH.

PARTICULARS of the new Grand Trunk shops at Port Huron, which are to replace the old shops destroyed by fire some time ago, are now available. The shops will be used for the most part for the repair of freight and passenger cars, and will cost in the neighborhood of \$1,000,000.

The principal car repair plant for the lines west of the St. Clair River has been at Port Huron, Mich., for many years, but was destroyed by fire during the winter of 1914-1915. The old plant was of limited capacity, and located at what was the old terminus of the line previous to the construction of the tunnel under the St. Clair River. After the fire negotiations were carried on between the town of Port Huron and the railroad, resulting in the acquisition of the property recently vacated by the Port Huron Thresher Co., which property is very much more advantageously situated, being near the new tunnel line.

The plant will consist of a powerhouse containing six 150-h.p. boilers, serving double turbo steam generating units of 300 k.w. for developing the electric power for lighting and operation of machines, all of which will be motor-driven; a passenger car shop of two units, 135 feet wide, with combined length of 545 feet, accommodating 27 modern passenger cars, and between the two units there will be a transfer table 80 feet in length; a freight car shop 160 by 360 feet, accommodating 70 freight cars; a cabinet shop, with two floors each, 73 by 250 feet; a blacksmith and machine shop, 150 by 300 feet; a wood mill, 90 by 210 feet; a dry lumber shed, 47 by 147 feet; a storehouse, 61 by 154 feet, and an office building, 61 by 64 feet.

The buildings, including trackage, will occupy an area of approximately 55 acres. They are arranged for economical operation, special attention having been given to this feature to ensure maximum efficiency.

### TRADE INQUIRIES

THE following inquiries relating to Canadian trade have been received by the Department of Trade and Commerce, Ottawa.

1535. Wire.—A South African firm of wholesale merchants, asks for quotations and samples where possible on barbed fencing and belting wire, also wire netting.

1536. Iron and Steel.—A South African firm of wholesale merchants asks for particulars of iron and steel sheets, bar iron, mild steel, bars and rods, angles, and other iron and steel products.

## Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department of Trade and Commerce, Ottawa, is able to present the following list of the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

<b>BRAZIL</b> Bahia, British Consul. Rio de Janeiro, British Consul General. <b>CHILE</b> Valparaiso, British Consul General. <b>COLOMBIA</b> Bogota, British Consul General. <b>ECUADOR</b> Quito, British Consul General. Guayaquil, British Consul. <b>EGYPT</b> Alexandria, British Consul General. <b>FRANCE</b> Havre, British Consul General. Marseilles, British Consul General. <b>INDIA</b> Calcutta, Director General of Commercial Intelligence.	<b>ITALY</b> Genoa, British Consul General. Milan, British Consul. <b>MEXICO</b> Mexico, British Consul General. <b>NETHERLANDS</b> Amsterdam, British Consul. <b>PANAMA</b> Colon, British Consul. Panama, British Vice-Consul. <b>PERU</b> Lima, British Vice-Consul. <b>PORTUGAL</b> Lisbon, British Consul.	<b>RUSSIA</b> Moscow, British Consul General. Petrograd, British Consul. Vladivostok, British Consul. Odessa, British Consul General. <b>SPAIN</b> Barcelona, British Consul General. Madrid, British Consul. <b>SWEDEN</b> Stockholm, British Consul. <b>SWITZERLAND</b> Geneva, British Consul. <b>URUGUAY</b> Monte Video, British Vice-Consul. <b>VENEZUELA</b> Caracas, British Vice-Consul.
--	--	--

## CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

### CANADIAN TRADE COMMISSIONERS.

<b>ARGENTINE REPUBLIC</b> H. R. Poussette, Reconquista, No. 46, Buenos Aires. Cable address, Canadian. <b>AUSTRALIA</b> J. H. Ross, Stock Exchange Building, Melbourne. Cable address, Canadian. <b>BRITISH WEST INDIES</b> E. H. S. Flood, Bridgetown, Barbadoes, agent also for the Bermudas and British Guiana. Cable address, Canadian. <b>CHINA</b> J. W. Ross, 13 Nanking Road, Shanghai. Cable address, Canadian. <b>CUBA</b> Acting Trade Commissioner, Lonja del Comercio, Apartado 1290, Havana. Cable address, Cantracom. <b>FRANCE</b> Philippe Roy, Commissioner General, 17 and 19 Boulevard des Capucines, Paris. Cable address, Stadacona. <b>JAPAN</b> G. B. Johnson, P. O. Box 109, Yokohama. Cable address, Canadian. <b>HOLLAND</b> Acting Trade Commissioner, Zuidblaak, 26, Rotterdam. Cable address, Watermill. <b>RUSSIA</b> C. F. Just, Canadian Government Commercial Agent, Alexandriyskaya, Ploshch 9, Petrograd. L. D. Wilgress, Canadian Government Commercial Agent, Bukhgozsa Ulitza No. 4, Omsk, Siberia.	<b>NEWFOUNDLAND</b> W. B. Nicholson, Bank of Montreal Building, Water Street, St. John's. Cable address, Canadian. <b>NEW ZEALAND</b> W. A. Beddoe, Union Buildings, Customs Street, Auckland. # INDUSTRIAL <sup>A</sup><sub>D</sub> CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## Engineering

**Victoria, B.C.**—An effort is being made to have the smelter at Ladysmith re-opened.

**Toronto, Ont.**—Cluff Bros. will build an extension to their forging plant, to cost about \$3,000.

**Lindsay, Ont.**—Flavelles, Ltd., have decided to rebuild their cold storage plant, recently destroyed by fire.

**New Glasgow, N.S.**—The Nova Scotia Steel & Coal Co. are building a large steel foundry at their plant here.

**Wainwright, Alta.**—B. L. Perry, of Edmonton, proposes to establish an electric light and power plant here.

**Whitby, Ont.**—The Canadian Tractor Co. proposes to build a plant here to cost \$60,000. Guy R. Greelman, Fenton, Mich. is interested.

**Pembroke, Ont.**—The Thos. Pink Co. and the Pembroke Iron Works have purchased the Victoria Foundry at Ottawa. The purchase price is said to be about \$100,000.

**Hamilton, Ont.**—The Tallman Brass Co. have had plans prepared for an addition to their factory, to cost about \$4,000. Architects, Stewart & Witton, Hamilton.

**Sudbury, Ont.**—It is understood that the British-American Nickel Co. are willing to establish a refinery at Murray Mine, near here, if the Provincial Hydro-Electric Commission will develop power in this district. The company would require 3,500 h.p. for their mines and smelter, and an additional 7,500 h.p. for the refinery.

**Trenton, Ont.**—The British Chemical Co. have a proposition to erect a chemical plant in this town at a cost of not less than \$300,000, and to employ a large number of workers. The town is asked for exemption from municipal taxes for ten years, and to contribute \$10,000 towards the purchase of a site of 134 acres.

**Brantford, Ont.**—A. J. Macpherson, of the Brantford Scale Co., and C. H. Herod, have left for Philadelphia and New York with the object, it is stated, of purchasing machinery for carrying out of a sub-contract for manufacture of fuse parts, which the company has received from the Russell Motor Co. The contract will

amount to about \$250,000 and must be filled by July 1, 1917. It is expected about sixty persons will be employed, mostly women, and that operations will be begun towards the end of December.

## Electrical

**Sudbury, Ont.**—The Hydro-Electric Commission may develop power in this district.

**Strathroy, Ont.**—The Town Council have authorized extensions to the street lighting system.

**Oil Springs, Ont.**—A hydro by-law will be submitted to the ratepayers at the elections in January.

**Welland, Ont.**—The local Hydro Commission will shortly begin the construction of a new sub-station at an approximate cost of \$40,000. The station will not be in operation before next September.

**Agincourt, Ont.**—Scarborough Council passed the Hydro-Electric by-law on November 20, empowering the Reeve and Clerk to sign up a contract for electrical power with the Ontario Hydro Commission. This is to apply for house and street lighting. A line will be run along the Danforth Road to Scarborough Junction, and then to Agincourt.

## Municipal

**Hamilton, Ont.**—The ratepayers in January will vote on a by-law authorizing the expenditure of \$5,000,000 for Hydro radials.

**Renfrew, Ont.**—A by-law is contemplated to authorize the purchase of the Renfrew Electric Light Co. from Thos. A. Low for \$6,500.

**Ottawa, Ont.**—The City Council propose building two public swimming baths to cost \$75,000. A by-law will be submitted to the ratepayers.

**Peterborough, Ont.**—A by-law will be submitted to the ratepayers at the January elections to sanction the purchase of a motor-driven combination chemical and hose truck, to cost about \$8,500.

**Brantford, Ont.**—The City Council have decided to submit a by-law to the ratepayers in January to decide the question of installing the municipal gas

from Tilbury which is said to be impure.

**Montreal, Que.**—A committee of nine prominent Montreal engineers, after a thorough investigation of the aqueduct scheme, have advised that the project should never have been started, and that all thought of completing it should be abandoned. A sum of \$5,200,000 has already been expended, and it would require \$5,000,000 more to complete it. The main contentions are that the capacity of the original aqueduct was sufficient for three times the present population served, and that the cost of developing power as proposed would be too excessive.

## General Industrial

**London, Ont.**—The D. S. Perrin Co. factory was damaged by fire on Nov. 20 to the extent of \$2,000.

**Acton, Ont.**—The Reliance Shoe Co., of Toronto, have awarded the general contract for the erection of a factory to J. B. McKenzie, of Acton. Approximate cost, \$13,000.

**Smith's Falls, Ont.**—The Canadian Cooperage Mfg. Co., whose plant was destroyed by fire recently, will rebuild. The new plant will be larger than the old one and will be completed during the winter.

**Winnipeg, Man.**—Negotiations are under way which will result in the establishment of a paper mill within the limits of Winnipeg. J. D. McArthur, lumberman and railroad builder, is the man behind the enterprise. The proposed mill is to have a capacity of 50 tons a day.

**Hamilton, Ont.**—The Turner, Day & Woolworth Handle Co., of Louisville, Ky., have secured the property opposite the Canada Steel Goods Co., and will commence the construction of a factory early in December. Lieut.-Col. Hatch, of Hamilton, who is a director of the company, was responsible for bringing this new industry to Hamilton.

**Port Arthur, Ont.**—It is reported that James Richardson and associates have concluded negotiations for a site on the Port Arthur waterfront, and that their plans for the erection thereon of a terminal elevator of 2,500,000 bushels' capacity would be proceeded with in time to guarantee its partial completion in the fall of 1917. The site is on the Port Arthur waterfront near the Saskatchewan Co-operative plant.

# An Opportunity and a Service

We have just purchased one of the largest Munition Manufacturing Plants in the United States: The Union Switch & Signal Company, one of the Westinghouse group at Pittsburgh, Pa.

The machine tools and equipment are practically new and of the latest type for the manufacture of:

## 4.5, 5 and 6 in. High Explosive Shells and Shrapnel

All machines are COMPLETELY TOOLED and equipped with the latest and most improved devices for insuring accuracy and large production. The Plant is composed of complete units for the manufacture of 1300 shrapnel, 2500 4.5" and 2500 5" and 6" High Explosives per day. The following list will give an idea of the quality and class of tools employed.

3X, 2X and 1X Reed Prentice Semi-Automatic Lathes, Libby and Steinle Turret Lathes, Hydraulic Automatic Machines, Amalgamated Lathes, High Speed Ball Bearing Drills, Thread Millers, Engine Lathes, Wave and Under-cutting Machines, Banding Presses, Plug Millers, Automatic Drop Presses, Copper Band Cut-Off Machines, Heavy Baker and Colborne Drill Presses, Machine Tool and Shell Grinders, Air Compressors, Cutting-Off Machines, Separators and a number of time and labor-saving specialties to aid production.

### *Special Features of Sale*

We will provide expert operators to demonstrate the machines and tools and to educate unskilled operators in their use. IMMEDIATE DELIVERY OF FULLY TOOLED AND EQUIPPED UNITS WITH COMPETENT DEMONSTRATORS TO INSURE IMMEDIATE AND SATISFACTORY PRODUCTION SHOULD APPEAL TO YOU.

PLANT WILL BE SOLD IN	CATED AT PLANT TO GIVE
COMPLETE UNITS OR IN	EXPERT ADVICE. MAKE
LOTS TO SUIT THE CONVENI-	ARRANGEMENTS TO IN-
ENCE OF OUR PURCHASERS.	SPECT MACHINES AT AN
SERVICE DEPARTMENT LO-	EARLY DATE.

*Complete Data on All Operations for Piece-Work Also Furnished.*

#### *HOW TO GET THERE—*

Take the Pennsylvania R.R. at 11.10 p.m. from Buffalo, arrive Pittsburgh 7.30 a.m. Spend the whole day with our representatives at the plant, leaving at 11.10 p.m. and arriving Buffalo 7.30 next morning.

*Address all inquiries to*

**The A. R. Williams Machinery Co., Limited**  
TORONTO, ONTARIO

*If any advertisement interests you, tear it out now and place with letters to be answered.*

## New Incorporations

**Lymburner Brass Works** of Montreal has been incorporated with a capital of \$50,000.

**The New Westminster Foundry Co.**, of New Westminster, B.C., has been incorporated with a capital of \$10,000.

**Walkerville Construction Co.** has been incorporated at Toronto with a capital of \$40,000 to carry on business as contractors and engineers at Walkerville, Ont. The provisional directors are James H. Walker, H. E. Walker, and Hiram H. Walker, all of Walkerville.

**Malloy & Bryans, Ltd.**, have been incorporated at Toronto with a capital of \$100,000 to carry on a planing and saw mill business with head office at Toronto. Provisional directors are F. M. McDowell, G. R. Sproat and G. B. Flett, all of Toronto.

**The International Feldspar Co.** has been incorporated at Ottawa with a capital of \$50,000 to develop mineral deposits and treat metals of all kinds. The head office is at Ottawa and the incorporators are J. V. Poaps, Nelson Hallister and Frank Curry, all of Ottawa.

**The Painless Horse-Shoe Nail Co.** has been incorporated at Ottawa with a capital of \$120,000 to manufacture horse-shoe nails and screws of all kinds. Head office is at Toronto and the incorporators are Wilson Rudd and Edward T. Thomlinson of London, England and Harold Griffiths of Croydon, England.

## Contracts Awarded

**Toronto, Ont.**—The Board of Control has awarded the following contracts for supplies:—Cast iron pipe, the National Iron Works and Can. Allis-Chalmers, Ltd; valves, James Robertson & Co.; special pipes, John T. Hepburn.

## Tenders

**Toronto, Ont.**—Tenders will be received, addressed to the chairman, Board of Control, City Hall, Toronto, up to January 16, 1917, for the installation of a 40 million Imperial gallon centrifugal sewage pump at the main sewage pumping station, Toronto. Specifications and forms of tender may be obtained at the Works Department, Room 6, City Hall.

**Winnipeg, Man.**—Tenders addressed to the undersigned will be received up to December 18, for the construction of 9½ miles of 5 ft. 6 in. reinforced concrete pipe. Plans, specifications and

form of tender can be secured on application to the district, accompanied by certified cheque for \$20. R. D. Waugh, chairman of Winnipeg Water District Commissioners, 901 Boyd Building, Winnipeg.

**Ottawa, Ont.**—Tenders will be received up to January 15, 1917, for the construction of a reinforced concrete lighthouse tower and fog alarm building combined, and a wooden dwelling at Point Abino, Township of Bertie, Welland County, in the Province of Ontario. Plans, specifications, form of contract and schedule of wages, can be seen, and forms of tender procured, at the Department of Marine, Ottawa; at the Harbor Master's Office, Toronto, and at the post offices, Welland, Port Colborne, St. Catharines, Bridgeburg, Hamilton and Brantford.

## Railways--Bridges

**St. Boniface, Man.**—The street railway will probably be extended to Transcona. It is also understood that the Greater Winnipeg Water District Commission intends to build an electric railway of its own from Provencher Bridge to Transcona by way of St. Boniface, Notre Dame Street and Mission Road, at an early date, the powers to do so being included in its charter.

## Marine

**Halifax, N.S.**—The Plant Line, which for many years has maintained a regular service between Halifax, Hawkesbury and Charlottetown, will discontinue its winter service at the end of the year and may not resume sailings in the spring.

**Sault Ste. Marie, Ont.**—The steamer Thorgerd, built in the Port Arthur Shipyards, has left here on her maiden trip. She will be used in the Atlantic Coast trade between New York and the West Indies. The Thorgerd is owned by a Norwegian firm.

**Halifax, N.S.**—The steamer Algonquin, which was bought last spring from the St. Lawrence & Chicago Steam Navigation Co., by the Nova Scotia Steel & Coal Co., has been sold to William Job, of New York, it is reported, for oil interests. She made two trips to Newfoundland, taking general cargo and returning with iron ore.

**The Canada West Coast Navigation Co.**, a new shipping concern, with Dominion letters of incorporation, has been organized at Vancouver, B.C., with capital of \$2,500,000 to engage in business as a shipping and transportation company. Contracts for eight wooden vessels of auxiliary schooner type have been let by

this company through H. W. Brown & Co., brokers, of Vancouver.

**Sir Trevor Dawson in Commission.**—The new steamer Sir Trevor Dawson, built at Superior Yards for the Canadian Steamship Lines, Ltd., and recently launched, has left to take on a cargo of 11,000 tons of ore at Missabe dock. She will take her cargo to South Chicago. The Dawson was built in part from a portion of the steamer W. C. Moreland, which was wrecked at Sawtooth Reef, Lake Superior, a few years ago.

**Montreal, Que.**—The Montreal Dry Docks and Ship Repairing Co., Ltd., which had to close their dock on account of the repairs to the Lachine Canal, took advantage of the circumstance to extend their plant. The length of the dock has been increased from 240 to 425 feet and the depth from 10 to 13 feet. The company expects to have eight or nine boats in for repairs during the next few months.

**Port Arthur, Ont.**—John Burnham & Co., associated with other banking interests, of New York, have purchased the Western Drydock & Shipbuilding Co., of Port Arthur. H. G. Chace has just returned to New York from an inspection of the property, which will shortly be refinanced to permit of an enlargement in capacity. The company is now constructing vessels for foreign countries. James Whelan, of Port Arthur, is president.

**Navigation Closes Soon.**—From present indications it is expected the next ten days will practically see the end of navigation on the lakes. Many boats that will make their last trips next week could have made another trip were it not that ore is frozen at the upper ports. The season just ending witnessed a record ore movement, but this has been consumed more rapidly than usual, and it is doubtful if there is enough ore at the lower end of the lakes to supply the furnaces during the winter.

**Haileybury, Ont.**—The entire fleet of the Timiskaming Navigation Co. has been purchased by Mr. P. Gibbons. In the deal also are included all the wharves and other equipment. The new owner proposes to convert the "Silverland" into a tug, while the "Jubilee" will be refitted somewhat and kept for towing purposes. The "Meteor" and the "Timiskaming" will be taken into the Government shipyards of the Lake Shore road to undergo repairs during the winter preparatory to their being used for passenger traffic on Lake Timiskaming next spring.

**Collingwood, Ont.**—The SS. "Sarnolite," which the Collingwood Shipbuilding Co. has built for the Imperial Oil Co., of Sarnia, ran her special trials on the measured mile course outside the harbor on Nov. 17, the results being in every

Mchy. Co., Ltd., Toronto, Winnipeg, St. John, N.B.

If any advertisement interests you, tear it out now and place with letters to be answered.

## Let Arithmetic Convince You

Take a pencil and paper.

Put down the number of men who use files in your shop.

Reckon up the probable number of minutes given by each one and by all per day to file work. Calculate this for 300 days, a working-man's year. Calculate the cost of file work for all your men for a whole year at local wages per hour. Add to this the cost of files, merchandise, depreciation charge. Now you'll have a surprise, and when we tell you that

### Delta Files

save man-time because they cut faster than any other file made, and that they outlive all other files because they retain their cutting edges longer than any other files will.

You have something to consider very seriously, and we believe that you'll agree with us that Delta Files are at least worth investigating.

A shape and size for every purpose. Delta Files are the only files of from 3 to 24 inches long, made absolutely of crucible steel.

Send for a sample file—to prove it.

**DELTA**  
**DELTA FILE WORKS**

PHILADELPHIA, PA.

CANADIAN AGENTS:

H. S. Howland, Sons & Co., Toronto;  
Starke, Seybold, Montreal;  
Wm. Stairs, Son & Morrow, Halifax;  
Merrick-Anderson Co., Winnipeg.  
ALL LEADING JOBBERS

way satisfactory to Captain R. W. Henderson, Marine Superintendent for the owners. This is the third steamer which the builders have delivered to the Imperial Oil Co. this year. The three vessels, namely, "Royalite," "Iocolite," and "Sarnolite," are going into service on the ocean this winter. The three ships are all of the same dimensions, 250 ft. x 43 ft. x 18 ft., moulded, 2,600 tons dead-weight, speed on trial 18.227 knots loaded.

**C. S. L. Vessel Charters.**—J. W. Norcross, managing director of the Canada Steamship Lines, makes the announcement that negotiations have been completed for the chartering of fifteen steamships for ocean service for the year 1917. At the present time Canada Steamship Lines have eighteen ships in ocean service, and although present arrangements only provide for the service of fifteen of these for 1917, it is likely that the whole fleet will be re-engaged again. It is announced that rates are considerably higher than a year ago. Mr. Norcross has just returned from a trip to London, where he had several conferences with the London Advisory Board of the company.

## Building Notes

**Toronto, Ont.**—A new departmental store, to cost, it is reported, \$15,000,000, will be erected on Yonge Street, below College. H. H. Williams, real estate, is handling the negotiations. The T. Eaton Co. are understood to be behind the scheme.

## Wood-Working

**Prince Rupert, B.C.**—E. F. Derby, of New Westminster, and J. S. Emerson, of Vancouver, will build a saw mill here.

**Drummondville, Que.**—Sash and door factory of J. A. Nadeau was recently destroyed by fire, with a loss of about \$15,000.

**Lachute Mills, Que.**—E. Charlesbois has commenced the erection of a sash and door factory, estimated to cost \$10,000.

**Warton, Ont.**—The lumber mill, owned by Johnson, Hunter & Crawford, has been destroyed by fire, the loss being estimated at \$10,000.

**North Vancouver, B.C.**—The Canadian Robert Dollar Co. are about to construct a sawmill and docks, at an approximate cost of \$200,000.

**St. Hughes, Que.**—The sash and door factory of Adelard Paquette, was destroyed by fire with a loss of \$20,000. It will be rebuilt and machinery for steam power will be purchased.

## Personal

**H. W. Aird**, manager of the Canada Paint Co., Montreal, died suddenly at his residence, Elm Ave.

**Charles Booth**, chairman of the Booth Steamship Co., died in London, England, on November 23, aged 76.

**Joseph Alfred Gendron**, founder of the Gendron Mfg. Co., Toronto, died at Ottawa, on November 25, aged 76 years.

**H. E. Rice**, of the Dominion Steel Corporation, Sydney, N.S., has been promoted to the position of assistant general superintendent.

**R. J. Durley, M.A.E.**, of Montreal, has taken over the unfinished work previously handled by the Montreal office of the firm of MacMullen, Riley & Durley, which was recently dissolved and re-organized as MacMullen, Riley & Angus. Mr. Durley will also continue his consulting practice.

**J. M. Nelson**, formerly with the Algoma Steel Co., Sault Ste. Marie, Ont., has been appointed superintendent of the Bethlehem Steel Co. open-hearth department, succeeding W. H. Bischoff, who resigned to become superintendent of coke ovens, blast furnaces and open-hearth furnaces of the Dominion Iron & Steel Co., Sydney, N.S.

**William Henry Jaques**, who did much to develop the American armor plate and ordnance industry, died at High Barnet, near London, England, on Nov. 24. Mr. Jaques was born in Philadelphia on December 24, 1848, and lived for the most of his life in the United States. He was active in many companies and was President of the Holland Submarine Co.

**C. R. Needs**, of Galt, Ont., a well-known civil engineer, is leaving for England this week, having enlisted in the Canadian Aviation Corps. Prior to the war Mr. Needs was resident engineer of the Canadian Northern Railway. Since the outbreak of war he has been an inspector of munition plants with the Canadian Inspection Co., principally of plants at Galt.

**Thomas N. Hicks**, for several years past assistant superintendent of the Niagara Falls Power Co., has been appointed general manager of the Renfrew, Ont., plants of the Niagara Alkali Co., and the Electro Bleaching Gas Co. Mr. Hicks is a graduate of McGill University, Montreal. He was with the Brooklyn Edison Co. for five years before coming to Niagara Falls.

**Sir Hiram Maxim**, inventor of the automatic system of firearms, died in London, England, on November 24. Sir Hiram Maxim was born in Sangerville, Me., on February 5, 1840. The Maxim

automatic gun was invented in 1884 in London, and was immediately adopted by the British Government. Some years later Sir Hiram was knighted by Queen Victoria after having become naturalized as an Englishman. He invented the first smokeless powder. In 1915 he was appointed a member of the Inventions Board created by the British Government to meet the needs of the war.

**David McNicoll**, formerly vice-president and general manager of the C.P.R., died on Sunday, Nov. 26, at Guelph, Ont., after a protracted period of ill-health. Mr. McNicoll retired from the C.P.R. two years ago. Mr. McNicoll was born in Arbroath, Scotland, 66 years ago, and started his railway career as a clerk in the freight traffic manager's office of the North British Railway. In 1874 he came to Canada, and entered the service of the Northern Railway of Canada at Collingwood, and served later on the Toronto, Grey and Bruce before joining the C.P.R. in 1883 as general passenger agent. He became second vice-president and general manager of the road in 1900.

## Trade Gossip

**The Dominion Forge & Stamping Co.**, of Walkerville, Ont., has increased its capital stock to \$1,000,000.

**F. H. Hopkins & Co.**, Montreal, have opened an office in the Mail Building, Toronto. Associated with them in the office will be the Toronto branch of the Dominion Wire Rope Co., of which Mr. Hopkins is vice-president. C. V. Osborn will be manager of the Toronto office.

**Advance in Iron Ore.**—Sales of Lake Superior iron ore have just been made at Pittsburgh at \$1.50 per ton advance over the prices current for 1916. This establishes the official price for 1917 at \$5.05 for Mesabi non-bessemer; \$5.70 for Mesabi bessemer; \$5.20 for Old Range non-bessemer; and \$5.95 for old Range bessemer at lower lake ports.

**Fraser & Chalmers of Canada, Ltd.**, Montreal, have been appointed Canadian agents for the Nordberg Mfg. Co., of Milwaukee, Wis., manufacturers of air compressors, hoists—steam, air and electric—Diesel engines, etc. The Nordberg Company make large Diesel engines of the Carls type. Geo. Saneton is general manager of the Fraser & Chalmers Co.

**Tungsten Lamps.**—It is anticipated that the manufacture of tungsten lamps will be simplified by a recent invention. Tungsten when melted or solidified is not malleable, so that it cannot be worked or drawn into wire. The addition of two per cent. boron or boron nitrate to the fused mass of metallic tungsten seems to overcome this difficulty, and forms the basis of the patent.

## Shell Forging Production

**WITHOUT AN EQUAL FOR  
 BOTH FIRST AND  
 SECOND OPERATION  
 PUNCHES.**

Comes to you heat-treated  
 and ready for use.

It does not stick to the  
 work.

There are many cases where  
 each punch has turned out  
 over 2,000 shells.

It means more shells, per  
 machine per day.

**STEEL OF EVERY  
 DESCRIPTION.**

**Hawkrige Brothers  
 Company**

303 Congress St., BOSTON, MASS.  
 U. S. A.

**The A. R. Williams Machinery Co.,**  
 Toronto, have purchased the entire  
 munitions plant of the Union Switch &  
 Signal Co., Swissvale, Pa. The ma-  
 chinery had been used for making 18  
 pdr. 4.5 in. and 5 in. shells.

**Steel and Iron Import Prohibition.**—  
 It is understood that the iron and steel  
 sub-committee of Lord Balfour's Com-  
 mittee which was appointed to make re-  
 commendations on the basis of the  
 Paris Conference economic proposals,  
 has presented a report urging the entire  
 prohibition of iron and steel imports  
 into the United Kingdom during at least  
 the period of demobilization and recon-  
 struction after the war.

**Southern Canada Power.**—At a re-  
 cent meeting of the directors of the  
 Southern Canada Power Co., F. W.  
 Teele, formerly vice-president and gen-  
 eral manager of the Porto Rico Railways  
 Co., was elected vice-president of the  
 Southern Canada Power Co. J. B. Wood-  
 yatt was appointed manager at the same  
 meeting. W. C. Hawkins, managing di-  
 rector of the Dominion Power & Trans-  
 mission Co., Hamilton, attended the  
 meeting.

**Montreal, Que.**—Announcement is  
 made that the control of the shares of  
 the Montreal Transportation Co., has  
 been purchased by L. L. Henderson  
 and associates. At a meeting of the  
 Board of Directors, Mr. Henderson was  
 elected president and managing direc-  
 tor, with A. A. Wright, of Toronto,  
 vice-president and treasurer. The  
 other directors are Messrs. Farquhar  
 Robertson, Abner Kingman, A. G.  
 Thomson, A. E. Ogilvie and H. A. Cal-  
 vin.

**The Canadian Fairbanks-Morse Co.,**  
 Montreal, have been awarded a contract  
 by the City of Charlottetown, P.E.I., for  
 the supply of a pumping outfit, consist-  
 ing of a Gould's horizontal single-stage  
 double-suction brass-fitted, centrifugal  
 pump. The pump will be belt-driven  
 from a Fairbanks-Morse 15 h.p. type  
 "Y" semi-Diesel oil engine. The unit  
 will have a capacity of 850 U. S. gallons  
 per minute against a total head of 30  
 feet when operating at 975 r.p.m. The  
 engineers are R. S. & W. S. Lea, Mont-  
 real.

**Hydro-Radials for Niagara District.**  
 —Engineer Stanley, of the Hydro Com-  
 mission has announced that when the  
 Hydro-Radial line is built to Niagara  
 Falls from St. Catharines, it will en-  
 ter Niagara Falls at a point between  
 Stamford and Southend. It will be four  
 miles shorter than the Niagara, St.  
 Catharines and Toronto Railway line,  
 now operated between the two cities  
 and 1½ miles shorter than the Grand  
 Trunk. The line will take in Merrit-  
 ton, Thorold and Stamford.

**State-owned Steamship Line.**—A state-  
 owned line of steamships is to be op-  
 erated between Atlantic and Pacific ports  
 of Canada by way of the Panama Canal.  
 The official announcement was made on  
 November 25 by Hon. Dr. Reid, Minister  
 of Customs. Contracts have been autho-  
 rized for the construction in British Col-  
 umbia of two vessels for this trade. For  
 some time British Columbia people have  
 been agitating for an arrangement  
 whereby all water communication be-  
 tween Atlantic and British Columbia  
 ports might be had via the Panama  
 Canal. It was found impossible to  
 charter vessels for such a service.

**Work for Returned Soldiers.**—The ex-  
 plosives department of the Imperial  
 Munitions Board, Ottawa, is prepared to  
 give employment to returned soldiers in  
 connection with the construction and op-  
 eration of chemical and explosives plants  
 which are being erected in Canada on  
 behalf of the British Government. Not  
 only are ordinary laborers required, but  
 positions are available for skilled work-  
 men. Large plants are being erected  
 and operated at Trenton and Renfrew,  
 Ont. Workmen of various trades are re-  
 quired at once, and preference will, in  
 every case, be given to returned soldiers,  
 provided they are willing to accept per-  
 manent positions.

**I. C. R. Eastbound Traffic.**—With the  
 closing of navigation on the St. Law-  
 rence there promises to be a very heavy  
 movement of eastbound freight over the  
 Government railways. Shipments to the  
 British Government will go over the In-  
 tercolonial to the seaboard at the rate,  
 it is believed, of 100,000 tons a month.  
 Special preparations have been made by  
 the Minister of Railways to provide the  
 road with adequate equipment for the  
 handling of this traffic. The rolling  
 stock has been largely reinforced by the  
 addition of box cars and a considerable  
 number of new locomotives of a power-  
 ful type. F. P. Gutelius, general man-  
 ager of the Government railways, states  
 that the Intercolonial is in excellent  
 shape both as to roadbed and rolling  
 stock to handle the winter traffic.

**Staff Loyalty Appreciation.**—When  
 all branches of business suffered on the  
 outbreak of war, the Canadian General  
 Electric Co. was faced with the alterna-  
 tive of discharging a large proportion  
 of the staff or of retaining as many as  
 possible on a 20 per cent. reduction of  
 salaries. It is commonly urged that in-  
 dustrial corporations are altogether soul-  
 less, but, in the subsequent dealings with  
 its staff, the Canadian General Electric  
 Co. have shown themselves to be ex-  
 cept that category. After the lapse of twelve  
 months, ten of the 20 per cent. reduc-  
 tion was reinstated, and the remaining  
 10 per cent. four months later. There  
 having been a continued improvement in  
 business, the company has decided to ap-

appropriate \$130,000 to repay the entire amount deducted, in recognition of the loyalty of the staff.

**Huge Shell Steel Order.**—It is reported from Cleveland, Ohio, that the Entente Allies have placed an order in the United States for 1,500,000 more tons of shell steel, for delivery during the second half of 1917. The order is said to have been placed through J. P. Morgan & Co. as financial agents of the Allies. According to the report, a considerable part of the order was for steel at \$80 a ton, as against the \$60 or \$70 paid on similar orders for delivery during the first six months of last year.

**Russia Wants Agricultural Machinery.**—C. F. Just, Canadian Trade Commissioner at Petrograd, states that the supply of agricultural machinery and implements in that country has been much commented upon lately, and the subject has never before received so much attention. With the active co-operation of the Ministry of agriculture, certain leading Zemstvos or municipalities, supported a central board for the purchase and distribution of agricultural machinery and implements in the districts represented. Mr. Just reports that the total requirements of the territories in question for 1917 are estimated at 96,800 machines, which include 45,000 reapers of foreign manufacture, 26,000 Russian lobogreikas, 15,000 mowers, 9000 horse rakes and 1800 binders. Siberia is also a potential market to be taken into consideration, where the need of agricultural machinery is even greater than in any part of Russia proper.

**The Canada West Coast Navigation Co.**—A new transportation concern, which has entered what is practically a new field in shipping in British Columbia, has some strong men on its board. Prominent among those who have invested their capital in the new undertaking are: James Carruthers, head of the Canada Steamship Lines; J. W. Norcross, of Montreal, vice-president and managing-director of the Canada Steamship Lines; James Whalen, of the B. C. Sulphite & Fibre Co., and president of the Western Drydock & Shipbuilding Co., of Port Arthur, Ont.; M. J. Haney, railway contractor, of Toronto; Sir Trevor Dawson, managing director of Vickers, Ltd., London, England; Roy M. Wolvin, a Great Lakes transportation man, and who is president of the new shipping company; H. W. Brown, president of the H. W. Brown Co., and formerly local manager of the Pittsburgh Steamship Co., Duluth, who is general manager of the Canada West Coast Navigation Co.

**Rubber Imports Increase.**—Of unmanufactured rubber, Canada imported during 1916 fiscal year 16,894,438 pounds at a cost of \$6,543,994, as compared with approximately \$4,500,000 in each of the years 1914 and 1915. Raw material has come into the country in much larger quantities than usual, and, on the other hand, there has been a very decided falling off in manufactured goods into which rubber enters as the principal component part. It is a matter of some importance, therefore, that the price of rubber promises to remain at a reasonable figure, and a figure that will still leave the producers a very handsome profit. For the twelve months ending July the imports of rubber and manufactures in which it forms the chief constituent amounted to \$10,221,000, as compared with \$7,514,000 for the previous twelve months. Our trade is, therefore, very considerable, and the steadiness of the price of the raw material is of importance. The greater proportion of the imports are on the free list. For the three months of the fiscal year ending June 30 these were valued at \$1,830,502, and the value of dutiable goods at \$823,029.

**Big Car Shortage.**—The Dominion Railway Board has issued a statement dealing with the car shortage situation in the Prairie Provinces, which has now become acute. The board has sent its chief operating officer, Mr. Spencer, to the West with a view to securing all possible co-operation between shippers and railway officials in facilitating the rapid movement of grain. The board's statement points out that, although the daily average of cars transported over the Canadian Northern System is lower this autumn than last, the reasons are largely attributed to causes beyond the control of the company. The crop this year is unevenly distributed; the heaviest traffic comes from the western portion of the grain fields, necessitating long hauls, and bad weather conditions have hindered steady threshing and loading. All the Canadian companies have had the car shortage troubles aggravated by the acute situation in the United States. On August 1 last there were only 9,762 idle cars in the United States. On September 30, there was an actual car shortage of 60,697, and on the first of this month the net car shortage was 108,010 cars.

**B. C. Timber Exhibits.**—So that possible purchasers may see what British Columbia can supply in lumber and other wood products, comprehensive exhibits have been placed permanently in the following public offices: Forest Branch, Victoria, B.C.; Forest Building, Hastings Park Exhibition, Vancouver, B. C.; B. C. Lumber Commissioner's

office, British Columbia House, 1 and 3 Regent Street, London, Eng.; B. C. Lumber Commissioner's office, Excelsior Life Building, Toronto, Ont.; B. C. Lumber Commissioner's office, 303 Dominion Building, Regina, Sask.; Industrial Bureau, Winnipeg, Man.; Department of Trade and Commerce, Ottawa, and at the office of nearly all the Canadian Trade Commissioners throughout the world.

**Ottawa, Ont.**—The Dominion Government, represented by E. R. Wood, of Toronto, has practically completed arrangements for the taking over of the Curtis aviation plant on Strachan avenue, Toronto, and running it as a Government aviation plant. Negotiations have been going on for some months, and it is now understood that the Government has arranged to take over the plant and the staff, and to run it until the new two million dollar plant at Ashbridge's Bay, plans for which are now being prepared by J. M. Lyle, the Toronto architect, are completed.

**Toronto, Ont.**—The Hydro-Electric Commission of Ontario has decided to undertake forthwith the construction of the projected canal between the Chipewa Creek and Queenston for the supply of 200,000 h.p. of additional electrical energy. It is proposed to procure electric-driven excavating machinery and thereby avoid the uncertain element of fuel cost and the exceptional demand upon labor. It is estimated that the electrical equipment will cost between \$800,000 and \$900,000, as it will call for general excavation machinery of the heaviest type, while the entire construction of the canal, which will be some twelve miles in length, will reach \$9,000,000. Estimates demonstrate, however, that considerably more than the entire cost of equipment and construction will be saved to the Hydro-Electric enterprise by undertaking the construction itself, not including the subsequent possession by the municipalities of the valuable construction equipment.

## Catalogues

**Belts,** the house organ of the Federal Engineering Co., Toronto, October issue, contains considerable useful information regarding belts, their use and maintenance.

**The Vanadium-Alloys Steel Co.,** Pittsburgh, Pa., has for free distribution a new pamphlet entitled "Vasco Vanadium," in which is given valuable information as to the study of alloy steels in general and uses of same. This pamphlet also describes the various types of Vasco Vanadium steel, together with a complete list of carbon steel extras.

**Drop Forgings.**—Canadian Billings & Spencer, Ltd., Welland, Ont., have issued a catalogue containing information relative to an extensive line of drop forgings, including more particularly clamps, wrenches, dogs, thumb screws, pliers, etc. Many of the principal lines are illustrated, while tables are included giving the chief dimensions and prices.

**The Nash Engineering Co.,** South Norwalk, Conn., have issued three bulletins, No. 4, 5 and 6, dealing with different types of equipment which they manufacture. Bulletin No. 4 illustrates and describes fully, turbine, vacuum, and low pressure boiler feed pumps for return line heating systems. No. 5 is devoted to a description of the Nash hydro-turbine, air compressors and vacuum pumps, single stage type. No. 6 deals fully with hydro-turbine vacuum pumps integral with electric motor. In each case details of construction are given and tables included giving the principal dimensions and other particulars of the various units.

**Flexible Shafts.**—Catalogue No. 10, entitled "Strand Flexible Shaft and Machinery," describes and illustrates an interesting line of flexible shafts showing the wide application of such equipment, particularly for grinding. The construction of the flexible shaft is described, as is also the tool post grinder spindle. Particulars are given of grinding equipments with motor, while illustrations show the application of the tools for various classes of work. The concluding pages contain a partial list of users of "Strand" flexible shafts and also information regarding the "Strand" high speed blowers. Copies of this catalogue may be obtained from the Canadian agents, The R. E. T. Pringle Co., Toronto.

**Stellite alloy** for high speed cutting tools is dealt with at considerable length in a catalogue recently issued by the Canadian B. K. Morton Co., Toronto and Montreal, who are the selling agents in Canada and Newfoundland for this material. The principal features of "Stellite" are described at length and the various claims made on its behalf dealt with in detail. Full instructions are included, covering the use of this material. The concluding pages give particulars of various other lines handled by the Canadian B. K. Morton Co.

**Die Forming Machines.**—Bulletin No. 1 deals with the die-forming machines and cutters made by the Anderson Die Co., Bridgeport, Conn., for use in the cleaning rooms of foundries. The machine is illustrated and fully described, as are also the main spindle and its parts. A price list is included, covering the "Anderson" super-helical, tapered, and straight milling cutters used in the above machine.

## Saving or Wasting?

The manner in which you handle the drinking water problem in your plant may seem to be a small matter to you—but investigate. The results will be surprising.

The old-time faucet is costly. Running hour after hour, day after day, its ceaseless flow is costing you money, yet without any better service.

### Puro Saves 35%

A Puro Sanitary Drinking Fountain will cut that water bill 35%. We can prove that it has done that for others.

It will give every employee a safe, safer draught of bubbling water free from the contamination of the common drinking cup.

In a word, it is the only sanitary Drinking Fountain that is really safe, sanitary, simple, automatic in control, and easy to attach.

## Book Review

### Natural Resources Development.

The focusing of public attention in Canada upon the problem of strengthening our national organization through increased industrial and commercial efficiency lends special value and interest to the Seventh Annual Report of the Canadian Commission of Conservation which has just been issued at Ottawa. The activities of this Commission, relating to the entire field of primary production, aim to secure greater efficiency in basic industry—in the development and utilization of Canada's natural resources. The resume of the past year's work is notable primarily for the progress recorded in the constructive programme entered upon by the newly formed Town Planning branch, with respect to one of our greatest and most urgent national problems, viz., the proper use and development of land, particularly in urban areas. Town-planning legislation of an advanced character has been secured in several provinces and thorough investigation of housing conditions has also been undertaken with a view to the drafting of model housing laws. Rapid progress has been achieved in the promotion of independent civic organization throughout the Dominion for the purpose of securing more general and thorough study of public questions. A second noteworthy feature is the attention devoted by the Commission to the reduction of the heavy economic handicap imposed upon Canada through her enormous annual fire losses. The Commission is engaged in a careful study of the causes, the extent and best methods of remedying this avoidable tax upon the country's resources. The section of the report containing the results of an agricultural survey in four representative countries presents accurate and definite data regarding the deficiencies of Canada's chief industry and affords a valuable indication of the lines along which efforts to improve rural conditions, economic and social, should be directed. Steady progress has been made by the Commission in the huge task of national stock-taking, the urgent necessity for which becomes daily more apparent. Recent experience has served to emphasize the need for accurate knowledge of the nature and extent of the Dominion's wealth in lands, forests, minerals, water-powers, fisheries and wild life, as a guidance to intelligent and permanent national expansion. The report, which is bound in cloth, and well illustrated, constitutes an important addition to the literature on Canada's resources and the problems connected with their efficient administration and development.

## The Great Business of Selling

**M**ULTIPLYING users of your product, In Canada, the one conspicuous magazine commodity or service—this is your is great business. The more, the merrier.

The factor of multiplication is advertising. Nothing else can get you new users in the shortest possible time at lowest cost.

Use magazines for long-living publicity effects.

Use them for Economy's sake.

Use them for Prestige.

### MACLEAN'S MAGAZINE

It is an all-the-family magazine of the highest class—clean, esteemed, established. Can you name a better? The conclusion is plain.

# Sheldons Ltd. Galt, Ont.

# Plant AND Product

GENERAL VIEW SHOWING TWO FACES OF PLANT EXTERIOR, GENERAL OFFICES ON CORNER.

## Staff Article

*The subjects of heating and ventilating are so closely associated as to be considered inseparable when putting into practice any scheme whereby either may have been deemed an installation necessity. The need for both is a large factor in our civilization, and in recent years it has come to be recognized as such to a greater extent. The steady growth of the plant described and illustrated indicates that Canada is fully alive to the benefits accruing from heating and ventilation progress. Kindred in large degree to both is the sphere of steam engineering, with respect to which it is only natural to find boiler and engine room specialties included in the otherwise scope of the Company's manufacturing enterprise.*

**A**BOUT twenty years ago the McEachren Heating & Ventilating Co., established a plant at Galt, Ont., for making ventilating fans. Five years later the Sheldons, who were interested in and also active members of the concern, took over the entire control and changed the firm name to Sheldons Ltd. In the earlier years the business, being a new development in Canada, was of comparatively small proportions, but has grown steadily until now it is one of the most important in Galt, and perhaps the leading business of its kind in Canada. The officials of the company are: W. D. Sheldon, president; S. R. Sheldon, vice-president, and J. P. Stuart, sec.-treasurer. The directors include W. D. and S. R. Sheldon, A. K. Spotton, Alfred Taylor and J. M. Smith, the last named being superintendent of the plant. The company maintain a branch sales office in To-

ronto, and have agencies in Montreal, Winnipeg, Calgary, Edmonton and Vancouver.

At the time of the reorganization fifteen years ago, a grey iron foundry was built making the plant self-contained. During the succeeding years, the business developed both in size and variety of product, a larger foundry became necessary, so in 1913 a large and modern foundry was constructed on the north side of the plant. This

additional facility made it possible for the company to still further extend the scope of their business. They are now able to make all the castings, iron or brass required in the manufacture of their various products, and also to make all kinds of iron castings for other concerns. In this connection it may be interesting to note that the company have for some time been making castings for firms in the United States. This in itself is a somewhat

unusual but at the same time gratifying development.

As already stated, the foundry lies along the north side of the property, while along the south side is the main building and offices. At the west side is a railroad track with a spur running into the yard, and on part of the east side is a storage. Other separate buildings on the property include pattern storage and a finished product storage, while pig iron and scrap piles are

UPPER MACHINE SHOP, SHOWING FAN CASE ASSEMBLY SECTION.

situated in the yard near the foundry. To return to the main building, on the ground floor at the east end is the employees entrance, tool room and machine shop, a section of the latter being utilized for assembling and testing heating coils. The offices are at the south east corner of the plant and are of course entirely separate from the machine shop. The middle section of the ground floor is a continuation of the machine shop, while at the west end is the fan erecting shop which includes a bar storage and store room for shop supplies. On the floor above at the west end is the fan housing erecting shop, the central section being the sheet iron department; at the east end is the pattern shop. Returning again to the ground floor, adjoining the machine shop on the north side are the power house, forge shop and heat treating plant.

#### Plant Products

The product of the plant may be summarized to consist of various types of ventilating fans, blowers and hausters, heaters, and the Eclipse air washer; steam specialties, including exhaust heads, steam traps, relief valves, oil separators, etc., together with grey iron castings of all kinds. The mechanical draft section of the business is the most important, and covers a wide range. Of the various types of fan made, the Keith multivane fan stands first, the chief merit of this type of fan being its ability to handle large volumes of air at a uniform pressure

board war ships. For this service the requirements are very exacting. This feature constitutes an important development in the company's fan business. Other types of fan include steel plate

for ventilating and shavings exhaust systems, and dust collectors. Blast gates, ball and socket joints, ore and mine cars, special dryers for leather, wool, hair, casein, etc. are also manu-

INTERIOR VIEW OF MACHINE SHOP, SHOWING FAN ERECTING FLOOR.

fans, steel and cast iron blowers and exhausters, fans for forced and induced draught, planing mill exhausters for handling wood and other materials, disc and propeller fans, etc. In connection with this branch of the business, the company make vertical and horizontal fan engines, heater coils, and the Eclipse air washer.

In addition to the steam specialties already mentioned, other products made

factured. In the new foundry all kinds of grey iron castings are made up to the limit of the 10 ton crane installed, although provision has been made for installing a 20 ton unit. Brass and aluminum castings are also made in the foundry, one section being set apart for these specialties.

#### Machine Tool Equipment

In the manufacture of mechanical draft equipment—fan wheels, housings engines, bearings, etc., a variety of machinery is required. The bulk of it is installed in the machine shop but a considerable number of tools are to be found on the floor above these consisting principally of punching machines, shears, breaks, etc. The following list includes machine shop tool equipment not mentioned specifically in connection with any particular product:—

Lathes by the R. McDougall Co., Galt, the Canada Machinery Corporation Galt; Stevens Co., Galt; McGregor, Gourlay Co., Galt; Walcott and Le Blond.

Radial drills by the American Bickford Tool Co., Cincinnati, Ohio, and the Dresses Machine Tool Co., Cincinnati.

Shapers and planing machine by the McGregor, Gourlay Co.; Stevens miller, Bertram horizontal boring machine; Landis grinder and pipe threading machines; Bertram shafting lathe, etc. A special machine is installed in the heater department for cutting heater pipes to length.

At the west end of this shop which is the fan erecting department are some

UPPER MACHINE SHOP, SHOWING GALVANIZED IRON WORK SECTION.

at a high speed. The patent rights to manufacture in Canada have been purchased. A number of Keith fans are now being built to be installed on

at this plant include elevator spouting, all kinds of sheet metal work fabricated from galvanized as well as black sheets. Under this category are included ducts

DUST AND SHAVINGS SEPARATOR

"KEITH" FAN WHEEL

CAST IRON EXHAUST HEAD

BOTTOM DISCHARGE MEDIUM BLOWER AND EXHAUST

BOTTOM DISCHARGE PRESSURE BLOWER

CENTRIFUGAL EXHAUST HEAD

large machines for plate work. These include a heavy double punch and shear for handling small structural shapes and heavy gauge plates; a Barnes drill; and Bawden lathe; 12 ft. plate shear; a set of plate rolls built on the plant for bending plates for fan housings, etc.; and two power hack saw machines. In this department the fans are assembled and some of the large size housings built up. The fan wheels are also made in this section of the plant. The shop supplies store room is located here. A well equipped tool room is situated at the east end of the shop. The tools in the machine shop are all motor driven, the number and capacities of the latter being as follows:—One 40 h.p.; two 20 h.p.; five 35 h.p.; one 30 h.p.; and two 5 h.p.; all a.c. machines. A band operated travelling crane runs the full length of the shop and an Otis freight elevator is also installed for transportation purposes between the main and first floors. For supplying power to a hydraulic press, a triplex  $1\frac{1}{2}$  in. x 4 in. belt driven pump, built by the Deane Steam Pump Co., Holyoke, Mass, is installed in the machine shop.

#### Fan Housing Department

On the first floor at the west end, the fan housings are marked off, sheared, drilled, punched and erected. A large variety of plate work is also done in this department. The equipment installed here includes a London Machine Tool Co. punch, also a shear by the same firm; a 10 ft. plate shear, a rotary shear, a 10 ft. brake and two drill presses by McGregor, Gourlay Co.

exhaust heads, dust cleaners, and separators. The Eclipse air washer is also built in this department. The equipment is similar to that installed in the aforementioned department but for handling lighter gauge sheets. There are several

PART FOUNDRY EXTERIOR AND STORAGE YARD.

bench power punches for working on small angles, bars, etc.; a set of light plate rolls; a Barnes drill press; one 10 ft. and two 4 ft. Dress & Crump brakes; one Quickwork rotary shear, and a Toledo electric welding machine.

At the east end of this floor is the pattern shop which is equipped with a shavings exhaust system. The principal machines installed include a Cowan jointer, a pony planer by the Preston Woodworking Machine Co.; a sand

with steel columns and roof trusses, the roof being of 2 in. matched boarding covered with Barrett roofing. Windows extend the full length and breadth of the building, also on the monitor roof above the centre bay. The foundry is 190 ft. long by 110 ft. wide, and is divided into three bays, the centre bay being 40 ft. wide, with a clearance height of 34 ft. The floor of the centre bay is used entirely for moulding, while in the South bay are installed a heating and ventilating plant, core room and ovens, cupola, brass foundry and cleaning department. On the North side are a number of moulding machines to which reference will be made later. Over the centre bay and operating throughout its full length is a 10 ton Northern electric traveling crane. The various movements of the crane are operated by three direct current motors of 15, 10, and 5 h.p. respectively. The crane runway and column were designed for a 20 ton crane which will be installed when necessity arises. A hand operated traveling crane is installed over the core room, and is equipped with a 1 ton Sprague electric hoist.

#### Heating and Ventilating Plant

A heating and air-washing system is installed in the foundry. The plant is located at the east end of the shop and consists of a Sheldon heater, Eclipse air washer and a No. 50 Keith fan driven by a 25 h.p. Sheldon, vertical high speed, enclosed steam engine. This outfit has a capacity of 50,000 cubic feet, and delivers air through

CORE ROOM AND OVENS, SHOWING BLOWER IN FOREGROUND.

The middle section of this shop is devoted to the manufacture of all kinds of galvanized sheet work such as ducts,

papering machine, column drills, wood turning lathe, tool grinder and hand saw.

concrete tunnels, one on each side of the main bay, extending the full length. Galvanized iron ducts are connected to the tunnels at each column, each duct

sure to the cupola. Provision has been made for another blower when a second cupola becomes necessary.

A tunnel of reinforced concrete 4 ft.

parts of the foundry where required. The water pipe is  $2\frac{1}{2}$  ins. in diameter, and conveys water from a spring on the property for drinking and general purposes. The air and water pipes are carried overhead and down each column where suitable connections are made.

#### Cupola Features

The cupola is 36 ins. inside diameter, has a capacity of 5 tons per hour and was built at the plant. The charging floor is 35 ft. x 48 ft., and materials are carried to it by means of an Otis-Fensom electric elevator 7 ft. x 4 ft., having a capacity of 2000 lbs. The elevator is operated by a  $7\frac{1}{2}$  h.p. 550 volt C.G.E. motor. A Fairbanks scale is installed on the charging floor for weighing the materials for the cupola, while draft for the latter is supplied by the blower already described.

#### Core Room and Ovens

The core room and ovens occupy a space 48 ft. x 35 ft. There are three ovens, 8 ft. x 14 ft., 6 ft. x 14 ft. and 4 ft. x 14 ft., and one drawer oven 4 ft. x 12 ft. The first three mentioned ovens are equipped with tracks, while all four are heated with individual coke stoves, fired from the back, the gases being carried away to a stack outside the foundry. The core room is equipped with the usual facilities for making cores and there is also installed a sand

CLEARING ROOM AT WEST END OF IRON FOUNDRY, SHOWING TUMBLING MILLS, ETC.

being fitted with a damper. Above the heating plant is a wash room equipped with showers, lockers, lavatories, etc., for the convenience of the work men. In this section of the foundry is installed a No. 9 blower driven by a 25 h.p. vertical steam engine, the entire unit being built by the company. The blower supplies air at 12 oz. pres

x 3 ft. by 150 ft. long has been constructed between the boiler room and foundry. Through this tunnel are carried steam, air and water pipes. The steam pipe is 6 ins. in diameter, and supplies steam to the fan and blower engines. The air pipe is 4 ins. in diameter and conveys air from the compressor in the power house to the various

CENTRE BAY OF IRON FOUNDRY LOOKING EAST.

mixer supplied by the Hamilton Facing Mill Co.

#### Cleaning Room

The cleaning room is located at the

watt tungsten lamps of 110 volts. In addition to the above, a number of 110 volt incandescent lamps have been installed at various individual machines.

high speed engine direct-connected to a Canadian Westinghouse generator running at 300 r.p.m. is also installed. This unit is really an auxiliary as the com-

EAST END OF IRON FOUNDRY, SHOWING CUPOLA AND CORE OVENS.

West end of the foundry, the principal equipment installed in same consisting of four tumbling mills, some grinders, and a sand sifter. The tumbling mills were supplied by the W.W. Sly Mfg. Co., Cleveland, and are as follows:— 48 ins. x 48 ins. x 72 ins. long; 24 ins. x 44 ins. x 48 ins. long; 24 ins. diameter x 48 ins. long, and 18 ins. diameter x 48 ins. long respectively. Adjoining the cleaning room is the brass foundry where are installed three brass melting furnaces heated by natural gas.

#### Moulding Equipment

The greater number of the moulding machines are arranged along the wall on the North side of the foundry. The principal equipment installed consists of three roll-over and one squeezer machines by the Tabor Mfg. Co., Philadelphia, Pa., one roll-over and squeezer by the Davenport Machine & Foundry Co., Davenport, Iowa; one roll-over and squeezer by the Arcade Mfg. Co., Freeport, Ill.; and two Grimes roll-over and jarring machines. In addition to the above mentioned are two pulley moulding machines by the E. A. Delano Co., Chicago, one for moulding pulleys 8 ins. to 16 ins. in diameter, and the other for pulleys from 17 ins. to 30 ins. in diameter. There is also one stripper by the Killen Mfg Co.

#### Lighting System

The artificial lighting of the foundry is most efficient. The centre bay has six 2000 c.p., 200 volt, arc lamps, and each of the side bays have eleven, 250

#### Power Plant

In the boiler room are installed two 130 h.p., 72 ins. by 18 ft. return tubular boilers, built by Goldie & McCulloch Co., Galt. These boilers supply steam for the various steam engine units around the plant and also for heating purposes. The power house adjoining, contains a 100 h.p. Wheelock Corliss engine, which drives direct one of the line shafts in the machine shop. This unit takes care of a considerable part of the power required in the machine shop, electric motors driving the remainder. A 75 h.p. Sheldon horizontal

pany employ hydro power for the shop motors to the extent of approximately 350 h.p. There is also installed a C.G.E. motor generator 3-wire 110-220 volt set. For supplying compressed air to the foundry and other parts of the plant, there is installed in the power house a steam driven air compressor built by the Canadian Ingersoll Rand Co. This machine is of horizontal type and has a capacity of 400 cubic feet of free air at a pressure of 100 lbs. per square inch. A switchboard in connection with the auxiliary generator and motor-generator sets is installed in the plant power house.

NORTH BAY OF IRON FOUNDRY UTILIZED FOR SMALL CASTINGS.

## MORE WOMEN WANTED FOR WAR WORK

THE British Ministry of Munitions are anxious to still further increase the number of women employed. This is, of course, already considerable, between 17,000 and 18,000 being employed in one shell-filling factory which was visited recently by Lord French. In other departments of munitions making, however, comparatively few women are as yet employed, although 800 to 1,000 additional hands per week are required. To increase the numbers available, special training schools have been established in various industrial areas. In some of the provincial towns there is, it appears, already a waiting list, but in London there are, it would seem, still many vacancies in the schools at Brixton, Shoreditch and other training centres. It is intended to devote one of the London schools specially to the training of girls in the light welding and other metal work required in aeroplane building. In Newcastle-on-Tyne rapid progress is reported at the women's training school opened in Rutherford College, where over 1,000 have applied for instruction. The period of training here extends over six to eight weeks. The large schools established at Birmingham in 1915, mainly with a view to training male workers, are now being used to give a similar training to women. A special feature at Birmingham is the advanced courses for students of either sex who show special aptitude. At Sheffield an attempt is being made to provide female chemists capable of taking up routine analytical work at blast furnaces and steel works for the period of the war.

## THE RUSSIAN LANGUAGE

FACILITIES for studying the Russian language are being provided in one centre after another, says the *British Trade Review*, and soon there should be no town of importance in the Old Land where the study of this language is not encouraged. A week or two ago, attention was called in these columns to the decision of the South of Scotland Chamber of Commerce to establish classes for the promotion of the study of Russian. Steps have now been taken in Glasgow for the founding of a Russian Institute, backed by the Corporation, the University and Technical College. Scottish firms, thoroughly alive to after-war possibilities, have already moved in the direction of winning the trade hitherto done by Germany in the Czar's dominions by arranging for representatives to be on the spot.

With a view to furthering this enterprise, the Glasgow Institute will devote its energies to instilling a knowledge of Russian commercial methods and needs

into the minds of its students. Scholarships are also to be provided for those who aim at remaining in Russia for a term to pursue their study on the spot. Of recent years a large weight of Scottish woollen goods has been bought in Scotland by Germany, and re-exported to Russia, but in future that trade will be carried out direct by the Scottish manufacturer. In point of fact, manufacturers are vying with one another to defeat the forlorn aim of the Germans to become the universal providers of the world.

## IDLE MACHINERY CLEARING HOUSE

THE British Minister of Munitions has established a Central Clearing House Organization for the purpose of tracing and registering machinery which is idle or about to become idle. The organization will endeavor:—

(a)—To ensure that contracts placed by the Ministry are directed towards any unoccupied manufacturing capacity which might exist in the country.

(b)—To place engineering contractors, who have suitable facilities for particular supplies, in touch with the Ministry and with other Government departments requiring these supplies, and to help contractors who are able to undertake additional or more suitable work now or at a future date to maintain continuous employment of their machinery and labor. Manufacturers possessing idle resources and desiring to be placed in touch with Government contracting departments are invited to communicate with the Central Clearing House, Ministry of Munitions, 8-9 Northumberland Street, W.C., when further particulars will be furnished.

The Minister of Munitions announces that he has made further orders under the Munitions of War Acts, 1915 and 1916, under which 74 additional plants have been declared controlled establishments. The total number of controlled establishments under the Munitions of War Acts, 1915 and 1916, is now 4,390.

## RETARDING PLASTER OF PARIS SETTING WITH ALCOHOL

ACCORDING to the "Journal Pharmaceutique et Chimique," investigators Astruc and Canals find that alcohol added to the water employed for slaking plaster of Paris has a very marked effect in retarding the time of setting and in lessening the degree of heat evolved in the reaction. This effect is directly proportional to the quantity of alcohol added. In round numbers, the addition of 10 per cent. of alcohol doubles the period of time required for the setting of plaster for surgical purposes. Thus,

10 grammes of plaster of Paris slaked with 60 mills (c.c.) of water took 14 minutes to set; with the addition of 10 per cent. of alcohol, 30 minutes was required, and with 25 per cent. an hour.

## EFFICIENCY IN MANAGEMENT NEEDED

IN order to reward every man according to his deserts, we must, says H. L. Gantt, have some means of measuring the efficiency of the service rendered. So far the only efforts that have been made in this direction have been applied to the workman and they have apparently not helped us to solve our industrial problem. It is absolutely necessary for us to measure the efficiency of those in control, for without efficiency in management, efficiency of the workmen is relatively useless, even if it is possible to get it. With an efficient management there is but little difficulty in training the workmen to be efficient. This has been proved so many times and so clearly that there can be absolutely no doubt about it. Our most serious trouble is incompetency in high places. As long as that remains uncorrected no amount of efficiency in the workmen will avail very much. Can we find a measure, or even a correct indication, of that efficiency? I think we can, but we shall have to revise our methods of cost accounting, for those at present in vogue are not designed for that purpose.

## MALE AND FEMALE EMPLOYEE CHARACTERISTICS

IN an article recently published, Arnold Bennett, in describing a visit to a national projectile factory, dwells on the characteristic differences of male and female workers as reported to him by the management. He was told that, "in the briefer operations demanding close concentration, the women rivalled and perhaps excelled the men, whereas in the long tedious operations (not demanding physical strength), the men easily beat the women, whose attitude was apt to be, 'Oh, bother, I've had enough of this exasperating dullness.'"

We do not know how far works managers in general would endorse this view. The opinion generally held is that women are particularly enamored of relatively simple routine work, which they are prepared to go on with day in and day out without change of occupation, which, indeed, is commonly resented. The man or boy, on the other hand, quickly gets "fed up" with work of this character, resembling the ancient Athenians in always desiring some new thing.

Don't guess at measurements when installing new machinery.

## RE-BUSHING GRINDING WHEELS

By F. B. Jacobs.

**M**ANY large manufacturing concerns use a number of grinding wheels in various departments for rough grinding of castings and general purpose work. As the stands upon

diameter, having three feet cast on it which allows setting level on an uneven surface should occasion require. The rough casting is mounted in a large lathe chuck and the face trued off, after which a  $\frac{3}{4}$ -inch hole is bored and reamed in the centre. The next step is to

used, the plugs should be 3 inches as shown in the illustration.

In re-bushing a grinding wheel, the first step is to cut out the present lead bushing with a compass saw as shown in Fig. 2. By making two cuts diametrically opposite, the bushing is easily removed by a few light taps with a hammer. The wheel is now laid on the disk and carefully set central by means of the nearest circle to its periphery. A plug of the correct size is next inserted and the new bushing cast in place. Lead is the best material for this purpose although any scrap stock of low melting point such as solder, die casting metal, etc., will answer the purpose equally well. The operation of re-bushing grinding wheels is so simple that any boy or handy man can do the work in a satisfactory manner, while the cost of the whole outfit should not exceed twenty dollars at the most.

FIG. 1. REBUSHING GRINDING WHEELS.

which these wheels are used are generally of different makes and sizes, it is not uncommon for the diameters of the wheel ends of the spindles to vary from 1-16 inch to  $\frac{1}{4}$  inch or more. Thus, while 16-inch wheels might be used in several departments, it is necessary to carry a superfluous stock to accommodate the various size spindles. To overcome this difficulty many manufacturers make a practice of re-bushing their grinding wheels as occasion requires, thereby eliminating the necessity of carrying individual wheels for each department where the sizes of the wheel spindles vary. The wheels are ordered with the correct sized arbor hole to fit the largest spindle, and with proper facilities they can be readily re-bushed to fit the other sizes of spindles at slight expense.

The following method for performing the work in question calls for but a slight outlay for equipment, and the results will be found to be very satisfactory. The necessary tools are a cast iron disk or plate as shown in Fig. 1, and several plugs of the same diameter as the various arbors on which the wheels are mounted. The plate should be as large in diameter as the largest wheels used, and, for the sake of illustration, the plate shown is 20 inches in

diameter, having three feet cast on it which allows setting level on an uneven surface should occasion require. The rough casting is mounted in a large lathe chuck and the face trued off, after which a  $\frac{3}{4}$ -inch hole is bored and reamed in the centre. The next step is to turn several grooves  $\frac{1}{4}$  inch apart. These can be cut with an ordinary threading tool, and are used to set the grinding wheel central while re-bushing its hole. Two heavy lines are next scribed on the disk 90 degs. apart, and near these lines the circles are stamped 1, 2, 3, etc. Several plugs are now made with one end to fit the hole in the disk, while the diameters of the large ends should be 0.002 larger than the arbors on the grinding stands. This slight clearance is sufficient to allow the wheels to slip on freely. The large portion of the plugs should be one inch longer than the thickness of the grinding wheels. Thus, if wheels with 2-inch face are

## WHAT HAPPENED TO HENRY

By D. S. Mann.

IN the past few years wonderful advances have been made in all materials of construction as regards quality and strength, but in no industry has this been exemplified to such an extent as in that devoted to the automobile. It is indeed marvelous how some of these machines in the hands of ignorant and careless owners are maltreated and still remain in running condition, and performing their natural functions.

In one of the Southern Louisiana towns which the writer visited during the irrigation season, the large pipe shown in the cut was being hauled in, and was left for the night across one of the street corners without any warning lights. This pipe was four feet in diameter and seventy-five feet long, and was used for a suction pipe in one of the larger irrigation plants; the weight was about 9,000 pounds. Some time during the night the Ford runabout, which was being driven without lights and by a one-eyed man as well, got into the position shown. How either the driver or the other occupant of the machine escaped serious injury is a miracle, but the pipe was just low enough to be caught by the top of the radiator and was entirely lifted out of the retaining blocks on the wagon bolster and carried over the side of the wheel so that about two-thirds of the total weight was on the machine. In addition to this, the front trucks of the wagon which weighed nearly as much as the Ford,

FIG. 2. REBUSHING GRINDING WHEELS.

were dragged about four feet to the one side. Besides breaking the wind-shield and radiator, and bending the steering column, the frame was only slightly bent, but not enough to take

into service in the condition in which they were found. No previous inspection had been made by the provincial authorities. It was believed that extensive repairs would be necessary be-

combining more or less with the sediment held in suspension by the water, formed a greasy deposit which settled on the heating surfaces, preventing the water from coming in contact with the plates, besides interposing a poor conductor of heat transmission, the result being that the plates became red hot and bulged. It is noteworthy that all three boilers comprising the battery were bulged, although two of them were so to a lesser extent. The development of the bulges may have been gradual, yet when discovered, all the boilers were in a dangerous condition.

Fig. 1 shows the deformation of the bottom shell plates of one of the boilers. The bulge extended half way round the circumference, and showed 22 ins. extreme depth. The plates had stretched circumferentially about 30 inches.

Fig. 2 is a view taken through the manhole door below the tubes on the front head and shows how the longitudinal stays bent when subjected to compressive stress, due to the boiler head around the manhole being pulled in when the shell plates bulged outwards. The inside lap of the girth seam at this point was about one inch clear of the bottom shell plates, and the head was distorted about seven inches from its original face line. It was fortunate that the bulged plates remained intact, and their having done so proves that the material 7-16 in. thick, must have been of very good quality.

Out in California a centrifugal blower, driven by an electric motor, is being used in the shelling of almonds. Formerly the nuts could be shelled by hand only with the greatest difficulty. At the present time the almonds are fed into the suction side of the fan, where they are picked up by the runner and hurled against the fan casing, following which they are blown out of the discharge pipe into a box, all ready shelled.

WHAT HAPPENED TO HENRY?

down and straighten. The car was again in commission in a few days with only a slight bill for repairs.

Had the pipe been six or eight inches higher, probably both occupants of the runabout would have been killed. It seems almost incredible that a machine constructed of such light material as this one could be capable of sustaining the tremendous weight with so little damage; there appears on the face of it a recommendation for the quality of the steel used in its construction.

### WHAT A BOILER INSPECTION REVEALED

By D. M. M.

TO a factory in Ontario, the Provincial Government boiler inspectors were recently called to examine a battery of old boilers that were again to be put in operation. It is a fortunate circumstance that inspection was required, for the boilers were in such shape that they would surely have blown up if put

fore the boilers could be used again, and, because of this, they automatically came within the jurisdiction of the steam boiler branch of the department of Public Works, Province of Ontario. Inspection revealed the condition of all three boilers to be such as to necessitate their removal and replacement by new units. Adhesion of oil to the bottom shell plates appears to have been the undoing of the different boilers. The illustrations taken from the worst of the three after removal from the brickwork setting speak for themselves. All three boilers were of horizontal, return tubular type, 72 inches diameter and 18 feet long.

The exhaust steam from the engines was discharged as condensate into a hot well, being afterwards pumped back without filtration into the boilers. In consequence, a considerable quantity of the oil and grease used for lubrication in the engines was carried into the boilers along with the feed water, and, after

## WHAT A TRADE SCHOOL BOY SHOULD KNOW\*

by J. C. Spence\*\*

FROM my standpoint, every boy and every girl, no matter what future calling they intend to follow, would be better able to enjoy an independent life, if they had the elements, at least, of a trade that requires skillful use of the hands and mind, provided the trade is taught in a professional school and not by amateurs. A clear understanding of the machinist's trade and its allied branches puts a man in a position where the everyday things of life are not mysteries to him.

I want to congratulate all of you on

man who gets a very high salary in his profession who has to call a plumber to pack a leaky faucet and yet this man looks on any one, not a plumber, who can cut a leather washer out of an old shoe and fix that faucet, as a world's wonder and he regrets very much that he cannot do such things.

To be sure, he can pay others for doing it but every one ignorant of these things cannot afford to pay for them although they have to. On the other hand, you who are mechanics know the satisfaction of being independent of outside help, even though your work, outside of your particular branch, may not measure up to the professionals yet it does what you set out to do and your

good personality. One should know that neatness of person, including clothing, hair and teeth, give very strong, favorable impressions. Do not chew tobacco or gum—you will need all of your jaw muscles for answering questions.

Wear the hat straight. Avoid "Rah-Rah," clothing of all kinds. If it is possible to get coats that are plain cut, without turned back cuffs or extra belts or forty-five degree slanting pockets, then get them. Older mechanics would as soon put up a shelf at forty-five degrees as to cut a pocket at forty-five degrees.

Never approach any man in business hours with any odor on your breath. Be careful how you handle doors and

BUSINESS ENTERPRISE IN CARTOON—NO. 1 OF A MONTHLY SERIES PUBLISHED BY COURTESY OF CANADIAN STEEL FOUNDRIES, LTD., MONTREAL AND WILLOWDALE.

having chosen to go to a school that teaches a man to earn a living. I do not agree with those people who look down on the so-called sordid side of life—the money making side. To my mind the practical trade side of modern life is of the first importance. After a trade has been acquired then let those of us who have the time acquire whatever art that appeals to us.

How much better off a man is who has a good insight into the workings of the telegraph, telephone, wireless telegraphy, electric motors, gas motors, airships, steam heating, etc. I know a

training gives you the sense not to tackle the jobs you can't do. I claim that we would have better ministers, lawyers, doctors, dentists, teachers and citizens in general, if all knew something of the principles of the machinist's trade, on account of the consequent increase in common sense.

### How to Get a Job

The getting of a job in good business times, is an easy matter. Whatever the times, however, the man who hires is very much influenced by those attributes known as "personality." Some people are born with, or acquire by instinct, or have forced upon them by relatives some of the essentials of a

chairs. Have your shoes clean, if the approach to the factory you are visiting will allow it. I presume that you are taught all of these things and also that you know them by previous training but there are so many boys who come to me lacking in these details that I think it best to mention them.

Do not go after a job haphazard. Pick out the factory you want to work in and then find out who to see there. Don't simply walk in and ask for "the guy dat hires the help." Go at it as you would go about selling any kind of merchandise. If you really believe you ought to work for that factory don't let them turn you down. Find out who has some influence with

\*From a Talk to the Worcester Trade School for Boys.

\*\*Superintendent, Norton Grinding Co.

the man in authority and pull any strings you are able to. If you have to, take the job that looks next best, take anything, but finally get the job you started to get. Don't let any one lick you in your first serious business undertaking. If you do, it will not be good for your soul.

### He Meant Business

Some time ago a young man from Chicago, twenty years old, came to me and asked for a chance to learn to grind. I told him business was bad and we were running short time and that I did not see my way clear to take him. He pulled a paper from his pocket and showed me a list of what he considered were the leading machine firms of this country. He said, "I cannot afford to go to a Technical School but I am going to be an engineer. I am willing to work every evening in my room. I have made up my mind to work for each of the firms on this list long enough to understand what the uses and good points of their machines and organizations are. I am going to work for your firm if I have to work for nothing. I saved a little money at the last place and I have a promise of a job at The Potter & Johnston Co., Pawtucket. I will work here for nothing until I have just enough left to get me to Pawtucket. If I went to a technical school, I would have to work four years for nothing and then would not get what I have planned to learn. Will you put me to work?"

I had to put him to work. I would not have been able to face myself, if I didn't. I took him at his word and let him work until I knew he wasn't bluffing. Then we gave him piece work and the foreman picked out snaps so he could make his living in the first three days of the week and devote the rest of the week to investigating us on his own time.

That boy had man-sized ideas on what he owed himself. He had thought out the capital and labor question in a manner that would put to shame the judgment of many of our leading men, to judge by the paper reports of their utterances. He had no foolish side that I could discover. He was clean from his eyes back. If he lives, he will manage large affairs. I can wish you no better outlook than that you may be like him. I tried to keep him but he had his own ideas. The superintendent side of me was sorry but the mechanic side of me was glad. I envied him his free soul and his future.

### Outlook the Standard

Having obtained a job in the machine trade, what should you know to hold it and to advance? First, you must know

that only in rare cases does advance in wages or position come through pull or length of service. Output is now the basis used by most firms and all of the up-to-date ones can tell who did each operation, how long it took, what it cost and what was spoiled. In addition to this there is a card for each operator which gives his particular productive history. The gains and losses are continually added and subtracted so that, at a glance, it can be seen whether or not he is a bargain.

The first idea, then, is to get it firmly fixed in your minds that any propaganda that preaches limited output and puts all men on a level is doomed. The spirit of ambition that has its birth with every free-born soul will not tolerate this hindrance to its growth. The more you restrict production the greater the incentive for the "boss" to get up some scheme to do the job another way and dispense with your services. There is nothing on the other side except for the few who lead. When the barnacles become too troublesome, the old ship either drifts onto the rocks or is hauled into dock and scraped clean. The live captains of to-day are always on the outlook for barnacles and do not hesitate to use the scraper.

During your school course you should learn the materials and tools used in your calling just as a surgeon learns his appliances. You must have intended to follow this business or you would be at school. Hence you owe it to yourselves to know as much as you can possibly learn about this business. I know that you must have recreation, but find time to visit foundries, forge shops, boiler shops, pattern shops, pressed steel plants, wire mills and every mechanical place where you won't be "thrown out." If you think you need the knowledge, take a chance on being "thrown out."

### Knowledge of Materials

Know your materials. Keep up to date on metals. Know for what purposes the various steels and irons and bronzes are best suited. It is astounding to learn how little the average draftsman or foreman knows about the things he deals with every day. If a lawyer knew as little law as most machinists know materials, he wouldn't get his second case.

Knowing materials also implies a knowledge of their ability to cut or to be cut. On each job put yourself in the place of the efficiency man to see just how fast it can be done at a rate possible of maintenance by you. Keep sketches and records of your work. You will need them some day when, as foreman or superintendent, you will be called upon to make

a price with nothing before you but a blue-print and the cold fact staring you in the face that on your ability to figure right depends the taking or losing of work for your firm. A good way to train yourself in this line is to always estimate how long it ought to take to do a job and then in doing it, make believe that some one else did the estimating and now you are going to show him up by putting it out in a time that will make him look like an amateur. You can have a lot of fun with yourself this way.

I once had a foreman who wanted to know what he could do to get more pay. I told him to take home a blue-print that night, put himself in my place and figure to the best of his knowledge how long it ought to take his men to make that piece. In the morning he came to me with the frank statement that he couldn't figure how it ought to take much more than half the time his men had been taking. I told him that between his statement and what his men were doing lay his possibilities for advancement. Between what the common herd are willing to think is enough to keep them from getting fired and what you can do by using your brains, lies the chance for your start in life.

### Interest in Waste Prevention

Don't take the attitude that because the shop isn't yours, that you should not worry about the waste of money. If you find that there is too much stock on a casting or a piece can be made another way, one road to advancement lies in the suggesting of corrections. If your ideas are not given a hearing, especially if they are adopted and you do not get favorable comment from your foreman, then you are in the wrong shop.

Don't flare up however, and resolve to keep your mouth shut after this, but go quietly about getting a job in a better shop. Don't hurt yourself to spite some one else, because, if you cease to take enough interest in your business to think along the lines of improvements you will cease to develop as a mechanic. While you are with a firm, be loyal to them. Stand up for the product. Tell all the good things you can about it. If you know any bad, tell it to the persons who ought to correct it. If you can't honestly say that you are working for a firm that makes goods good enough for their intended purpose, then it is time to begin to hunt a new job.

Remember that rewards do not generally follow immediately on the heels of good performance. It takes time to get big returns on any capital. When you do your best on a job, you are adding to your bank account with some firm.

Some day a dividend will be declared. When you do not do your best on a job you are spending some of the capital already to your credit. If the spendings are greater than the savings you will one day face a deficit.

Among the officials of the concern for which I work, there are many discussions of the possibilities of using such and such a man for such and such a job. Do not fear that you will not be known to those who can use you. Your only care should be to be favorably known. See to it, also, that you do your own thinking. Listen to any one you may wish to, read what pleases you, but listen to and read both sides of all questions that pertain to your welfare.

Do not delegate to any man or body of men with axes to grind for themselves, the right to do your thinking or to make your decisions for you. Your future, outside of those traits or capacities imposed on you by accident or heredity, lies in your hands.

#### ADVISORY COUNCIL ON INDUSTRIAL AND SCIENTIFIC RESEARCH

THE following honorary Advisory Council on Industrial and Scientific Research was on Nov. 30 established by the Canadian Government:—A. Stanley MacKenzie, Ph.D., president of Dalhousie College and University, Halifax; F. D. Adams, Ph.D., D.Sc., Dean of the Faculty of Applied Science, McGill University, Montreal; R. F. Ruttan, M.D., professor of Organic and Biological Chemistry, McGill University, Montreal; J. C. McLennan, Ph.D., University of Toronto; A. B. Macallum, M.B., Sc.D., University of Toronto; Walter C. Murray, LL.D., president of the University of Saskatchewan, Saskatoon; R. Hobson, Steel Company of Canada, Hamilton; R. A. Ross, consulting electrical engineer, Montreal; and Tanerede Bienvenue, general manager of La Banque Provinciale, Montreal.

The appointment of this Council is a forward step designed to stimulate the industrial development of Canada on scientific lines, as has been done already in many countries. The need for such a step was emphasized by Sir George Foster in the House of Commons last session. Since then he has been studying the procedure of other countries and has placed himself in communication with scientific and research experts in various Canadian cities, who have given attention to this question. The Council now appointed will work along the lines already being followed in Great Britain, where the Advisory Council is responsible to a ministerial sub-committee according to a plan proposed by Mr. Arthur Henderson.

The scheme went into operation in Great Britain in July, 1915, after which a proposal was made that its scope be extended to the overseas Dominions, a proposal which was adopted in principle.

#### Universities' Co-operation

In January of this year circulars from the Minister of Munitions were sent to universities in Great Britain and Canada inviting co-operation in the improvement of appliances for land warfare. The universities have supplied information as to their facilities for research work and have expressed their willingness to co-operate with some branch of the Dominion Government.

Sir George Foster has recommended, and there has been appointed, a sub-committee of Council, consisting of himself and the Ministers of Interior, Mines, Inland Revenue, Labor and Agriculture to work with the Advisory Council. Their duties are to secure the co-operation of other bodies in the work of scientific and industrial research. The most practical and pressing problems presented by industrial necessities will be directed by the committee to the research bodies for solution. Reports will be made from time to time on the results of the investigations.

The practical necessities to be dealt with are the utilization of waste products, the discovery of new processes, mechanical, chemical and metallurgical, and the development of the unused natural resources of the country into useful adjuncts of industry. The importance of the step now being taken has been specially evident under war conditions when the scarcity of certain compounds and processes has caused confusion and paralysis in industries, and has added greatly to the cost of living.

In addition to the facilities offered by the universities of Canada, private, corporate and government laboratories are more or less engaged in research work. The Manufacturers' Associations also have signified their desire to co-operate in the research work in relation to the industries of the country. The new committee will of necessity travel about in carrying on their work.

#### PLATE GIRDER STIFFENERS

STIFFENERS, as commonly used on plate girders, perform two functions. Those placed at frequent intervals along the girders prevent the web from buckling as a column because of diagonal compression. Stiffeners placed under concentrated loads or over supports distribute the concentrated force, which would otherwise be delivered directly to the flange, over a considerable portion of the depth of the web. These latter stiffeners assist also in preventing the buckling of the web. The General Specifications of the American Railway En-

gineering Association for Steel Railway Bridges, 1910 edition, state, "There shall be web stiffeners generally in pairs, over bearings, at points of concentrated loading, and at other points where the thickness of the web is less than 1-60 of the unsupported distance between flange angles. The distance between stiffeners shall not exceed that given by the following formula, with a limit of 6 ft. and not greater than the clear depth of the web:  $d = t \div 40$  (12,000—s), in which  $d$  = clear distance between stiffeners of flange angles,  $t$  = thickness of web,  $s$  = shear per square inch."

#### A SELF-LUBRICATING METAL

A SELF-LUBRICATING metal is reported to have been produced in the United States, in which the mechanical strength of graphite is increased by impregnating it with a metal. The mixture is called "Graphalloy," and is not injured by contact with oil; in fact, oil can be used along with it. The manufacture of the alloy is described in the "Scientific American." The graphite is placed in a crucible of the same material, together with the molten metal, with which it is to be impregnated. The crucible is then placed in the cylinder of a large press, and a partial vacuum created simultaneously with the application of heat. Upon the completion of this operation, high-pressure air is admitted to the cylinder of the press. The plunger of the press on which rests the crucible is also forced up by hydraulic pressure. After impregnation, the graphite is found to have absorbed metal enough to increase its original weight by 150 per cent. For bearing purposes the alloy used is babbitt.

#### PRIVATE MOTOR MAKING STOPPED IN BRITAIN

THE British Minister of Munitions has made an Order under the Defence of the Realm Regulations. It prohibits as from November 15 until further notice any person, firm, or company engaged in the manufacture or repair of any vehicle designed for mechanical transport or traction, or any part of such vehicle from carrying out in any factory, workshop, or other premises, without a permit issued under the authority of the Admiralty, the Army Council, or the Minister of Munitions, any work consisting in the manufacture, assembling, or erection of any new or unused motor internal combustion engine designed or adapted for mechanical traction, or of any new or unused motor cycle, motor chassis, motor wagon, or of any tractor or other motor vehicles of any kind, propelled by mechanical means, subject, however, to the following exception:—Work required to complete contracts placed by the Admiralty, the War Office, the Minister of Munitions, or an Allied Government on or before the date of this order.

## Production of 9.2 ins. High Explosive Shell Forgings

Staff Article

*Uniformity of product in forging work is dependent to a great extent on the ability of the plant to maintain a steady rate of production. This involves well-balanced equipment, reliable in operation, accurately tooled, and systematically operated. These features are possessed in high degree by the plant hereunder described, every possibility of backlash in operation having been eliminated, so that thoroughly satisfactory results are obtained.*

**T**HE production of forged blanks for large sized shells is characterized chiefly by simplicity and massiveness of equipment, high degree of power required for the operations, and desirability of continuous operation. The various items of equipment range from pneumatic chipping hammers of a few pounds weight to hydraulic presses of many tons.

Work on the material preparatory to forging consists of cutting into billets, breaking the billets off the bar, inspection and removal of seams and other flaws. The material from which 9.2 in. blanks are forged is received from the steel maker in the shape of round bars about 8 or 9 ft. long and 9½ in. diam.,

sawn roughly to length as delivered from the blooming mill.

The required size of billet is roughly 20 in. in length and the output, necessary to maintain the press equipment in constant operation is obtained by the use of multiple machines which cut four pieces simultaneously. The use of such machines was facilitated by the fact that the bar is not cut clean through, but only to a depth of about 1½ in. leaving a core which is latterly broken off by dropping a weight on the bar. This core of approximately 6 in. dia. possesses sufficient strength to drive the bar under the load of 12 cutting-off tools employed in each machine.

The illustration gives a good idea of

the arrangement of these machines which have been developed specially for such work by the Southwark Foundry & Machine Co. Four frames are mounted on a bedplate, each frame having three pneumatic cylinders which feed individual tools into the work. The work is driven by a simple form of automatic clutch carried on a heavy spindle which is gear driven by electric motor. As any one tool may become dull more rapidly than the others, the pressure required to feed it in is greater, but as the pressure of air is elastic, the tool simply does less work and is not driven to destruction as would be the case with a positive gear feed. Handling of the bars is done by two horizontal hydraulic rams which

MULTIPLE CUTTING-OFF MACHINES WITH PNEUMATIC FEED CUTTING FOUR BILLETS SIMULTANEOUSLY.

push the bar into position from the open end of the machine, the ejecting ram being located inside of the spindle.

The application of oxygen cutting to this work is also illustrated, the machine being on the same general lines, but provided with four oxygen jets in place of cutting-off tools, and the spindle arranged to make one revolution

rows of billets are descending at the same time. Where the slope runs onto the hearth, it broadens out to allow room for turning the work about.

Heat is derived from coal, fed in by two American stokers of the underfeed type, the

yoke, the central or working ram exerting a total pressure of 700 tons when operating at a pressure of 1,500 lbs. per sq. in. Two of the smaller cylinders

OXYGEN CUTTING-OFF MACHINE PRODUCING FOUR BILLETS PER REVOLUTION.

TRANSFERRING A HOT SHELL BLANK FROM THE PIERCING PRESS TO THE FORMING PRESS.

only to complete the work. The Davis-Bournonville burner equipment was installed by the Carter Welding Co., and utilizes oxy-acetylene gas in pre-heating the metal to a point where the pure oxygen supports combustion, thus melting the metal out of each groove.

The grooved bars are now placed on supports and broken by a falling weight, the resulting fracture being subject to inspection to determine the exact condition of the metal, further inspection of the exterior resulting in occasional billets being set aside for the purpose of removing surface flaws. Many of these are due to scale and slivers which are easily removed by chipping off with pneumatic hammers and chisels. In some cases, however, the flaws are more than skin deep and their investigation to a depth of even one inch may be necessary before acceptance. Owing to the steady strain and depth of cut, the work of chipping flaws is done by an ample squad of men equipped with Cleveland hammers and safety goggles.

The work of forging, properly speaking, commences with the heating of the billets. This is done in a continuous furnace the bed of which is inclined at about 15 degs., from the entrance down to the hearth. The sloping part of the bed is wide enough to allow two billets to lie end to end across, so that two

products of combustion passing up along the sloping part of the furnace from which they are discharged to atmosphere at some height above the ground.

Overhead tracks enable the hot billet to be rapidly conveyed from the hot furnace to the 1st operation press. This machine, like the others, is Southwark equipment and is an excellent example of forging machinery. Five separate cylinders are mounted on the upper

are located on opposite sides, and operate a floating yoke which carries a portion of the die. After the billet is in position in the permanent die, this yoke descends and remains in position while the main ram is engaged driving the punch down into the billet, piercing it and roughly shaping the lower part or nose which is enclosed.

The punch is now withdrawn by the main ram when returning, the yoke referred to acting as a stripper, after

REMOVING FLAWS AND SCALE WITH PNEUMATIC HAMMERS PREVIOUS TO INSPECTION.

which the yoke itself ascends and allows the forging to be ejected, this being done by the two remaining rams which are connected by heavy chains to the ejector device below the table.

The work performed by the second press is similar in character to that described except that no piercing is done, the operation being chiefly to impart a correct profile to the nose and otherwise cause the forging to more nearly assume its final form. The press in this case is less powerful, being of 500 tons capacity, and provided with hand-operated stripping yoke, etc.

The forging, still hot from the second operation, is now transferred to a drawing press arranged horizontally in order to accommodate the long stroke necessary for the operation. The die block is conveniently located from the second press so as to avoid delay, and the long ram is suitably supported to prevent sagging during the operation. The total length of the drawing press, including die block, ram and cylinder, is fully fifty feet.

The drawing ram carries the shell clear past the end of the die block when an inverted U-shaped stripper descends behind the shell, preventing it from going back with the returning ram. The stripped shell runs down an inclined roller runway to a small platform where it is marked with identification letters and then rolled along a narrow gauge track to the cooling bed to await shipment to one of the various machinery plants engaged on this size of projectile.

CONTINUOUS BILLET HEATING FURNACE SHOWING FEED TABLE AT UPPER END OF INCLINED BED.

### ARTIFICIAL HAND COMPETITION

A CIRCULAR has been issued by the Societe Nationale de Chirurgie, of Paris announcing that an offer has been made to the Societe of a prize of 50,000 francs, to be given as a reward for the best mechanical apparatus for use by men who have lost the use of their hands. The announcement is to the following effect:

All competitors must belong to allied or neutral nations. They are to present to the Society mutilated men who have been using their apparatus for at least six months. The Societe de Chirurgie

will experiment with each apparatus on mutilated men for the length of time it thinks fit. The apparatus rewarded is to remain the property of its inventor. The competition will be closed two years after the end of the war.

MM. Faure, Kirmisson, Queen, Rieffel and Rochard, who make up the committee elected by the Societe, inform the public of the condition of the competition, as stated by the donor, and beg any person wishing to compete to send his application and apparatus to M. Le Secretaire General de la Societe National de Chirurgie, a Paris, 12 rue de Seine.

FINISHED FORGINGS BEING DELIVERED FROM HORIZONTAL DRAWING PRESSES. NOTE STREAMS OF COOLING WATER ON DIE OF NEAREST PRESS.

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## HAMMER SHELL NOSING APPARATUS

THE illustration shows the Whelan nose apparatus, which has been designed with the express object of forming a uniform and concentric nose

chine Co., Cleveland, O. Both sizes are similar in design, having the base and column cast in one to insure maximum rigidity. The bottom surface and arm-bearing are finished before placing the casting in jig for boring the supporting

a No. 1 Morse taper; steel, fibre, steel thrust bearing on each.

The belt shifter is supported on the outer end of the cone shaft, and can be pivoted around to suit any angle of belt by which machine may be driven. The principal specifications are respectively: greatest distance from spindle to table,  $7\frac{1}{2}$  in. and 12 in.; vertical movement of spindle,  $2\frac{1}{4}$  in. and  $3\frac{1}{2}$  in.; vertical movement of table, 6 in. and 7 in.; centre of spindle to frame,  $5\frac{1}{4}$  in. and  $7\frac{1}{2}$  in.; net weights, 60 lbs. and 110 lbs.

APPARATUS FOR NOSING SHELLS WITH HAMMER.

on shells undergoing this operation, the work being performed with such accuracy that the necessity for inside profiling after nosing is entirely eliminated.

The apparatus consists of a horizontal frame, built up of steel sections and provided with accurately planed machinery steel ways, on which travels a work carriage or headstock, moved to and from the hammer by a large hand-wheel.

The shell is held in a chuck mounted on the carriage spindle, which is revolved by a self-contained air motor, so that the hammer dies act on all parts of the shell nose as it revolves, the closing of the nose being gradually increased as the shell is fed towards the hammer. In addition to revolving the spindle, the air motor is also arranged to open and close the chuck.

The range of the apparatus covers 4-in., 5-in. and 6-in. shells, and it is stated that over 35,000 shells have been produced by one installation without any defects in the work or apparatus. The A. R. Williams Machinery Co. are placing this apparatus on the Canadian market.

## SENSITIVE DRILL PRESS

A SENSITIVE drill press possessing interesting features of construction is built in two sizes by the DeMooy Ma-

chine Co., Cleveland, O. Both sizes are similar in design, having the base and column cast in one to insure maximum rigidity. The bottom surface and arm-bearing are finished before placing the casting in jig for boring the supporting

hole for spindle bushing, thus insuring the spindle being at right angles to the table.

The spindle is of high carbon steel, and in the smaller size is tapered to fit small drill chuck, the larger size having

SENSITIVE DRILL PRESS.

## NEW MODEL POWER HACK SAW

AS a result of their long connection with the metal-cutting industries through the manufacture of hack saw blades, the L. S. Starrett Co., Athol, Mass., have placed on the market a power hack saw which combines several features calculated to give increased efficiency in operation.

The base casting is of pleasing and compact design, and represents a step

IMPROVED POWER HACK SAW SHOWING DASH POT AND FOOT TREADLE.

still further forward in that refinement of appearance, and utility of construction, which has characterized this class of machine in recent times. The saw frame is mounted on a rectangular slide, with a bearing  $11\frac{1}{4}$  in. long, accurately fitted with an adjustment for wear and provided with a quick-acting saw tightener to hold the blades square. The stroke is adjustable for stock from 1 in. to 6 in. diameter; 14 in. blades are regularly used, but 12 or 13 in. blades may be used when required.

Among the points of particular interest to users are—the stroke adjustment, which allows the full length of the blade to be used, irrespective of the size of stock, giving uniform wear of blades and fastest cutting; a foot treadle for raising the saw frame, requiring less effort on the part of the operator and

leaving both hands free for handling stock; an oil dash pot controlling the descent of the blade, so that it does not drop on the work and break, also allowing the teeth to enter gradually without stripping; lastly, an automatic locking

OPPOSITE SIDE OF POWER HACK SAW SHOWING DRIVING GEAR TO FRAME.

device which prevents the saw dragging on the return stroke, and also holds the saw frame at any height when stopped for setting work.

A pump and lubricant tank are located inside the base, and are easily removable for cleaning. The height over all is 48 in., and to top of table, 28 in. Floor space occupied is 14 x 32 in.

#### BALL-BEARING HIGH-SPEED BENCH SAW

THE illustration shows a portable ball-bearing bench saw designed for sawing soft metals, fibre, wood, etc. The saw arbor runs at 3,500 r.p.m. on ball bearings mounted in dust-proof housings, with provision for ample lubrication. Speeds from 1,000 up to 6,000 r.p.m. can be supplied when desired.

BALL-BEARING, HIGH-SPEED BENCH SAW.

The machine, which is a recent product of H. G. Crane, Brookline, Mass., is accurately and substantially constructed, the lower part or stand being made in one casting. The motor is hung in an inverted position on a specially designed dust chute, which is hinged at the upper end. The chute serves to protect the motor, and also permits a convenient method of keeping the belt in proper tension. The turning of a hand-wheel raises or lowers the motor at will.

The illustration shows the saw table equipped with a 1/2-h.p. direct current motor, with starting box and switch. The table top is quickly raised or lowered to any position when it is desired to do grooving or slotting. The guides are easily and quickly adjusted in position, and are interchangeable to either side of the saw. The plate-glass shield, supplied as an extra, can be attached or detached without the use of tools. Motors for 110 or 220 volts, alternating or direct current, and of 1/4, 1/3, and 1/2-h.p., can be supplied to answer various requirements.

The principal dimensions of the machine are as follow:—Size of top, 16 in. x 22 in.; height of machine, 18 in.; weight with 1/2-h.p. motor, 150 lbs.; size of saws, 8 in.; capacity for sawing, 2 1/2 in. stock.

**Want Industrial Commissioner.**—At a recent meeting of the B. C. Manufacturers' Association, held in Vancouver, a movement was initiated to urge the new Provincial Government to appoint a Provincial Industrial Commissioner who would work in conjunction with industrial commissioners now employed by municipalities and who would look after the industrial data in places which have no such officials.

#### HAND MARKING MACHINE

THE machine shown in the accompanying illustration was designed to meet the demand for a low-priced machine for marking trade, name, size, or patent marks on all round or flat surfaces of tools, such as drills, taps, dies, etc. Any material or article suitable for receiving impressions can be effectively handled in this No. 6 machine, which is built by the Martin Machine Co., Greenfield, Mass.

The article to be marked, if having a flat surface, is held on the table by a suitable fixture, when, by pressing the foot treadle, the table is raised to the proper height, when the die, which is held in the holder attached to the horizontal slide, is brought into contact with the work by means of hand lever, which forces the slide across, and causes the die to roll the impressions in the work.

When marking round surfaces, such as taps or dies, a flat die is attached to the slide and the work allowed to roll on the table, while the die is in contact with it. Adjustments are provided when using round or flat dies, so that the pro-

HAND MARKING MACHINE.

per character on die shall come in contact with work at stated point, and screw stops are provided to govern the amount of travel after contact is made so that a clean cut is made at the beginning and end of the work.

Both table and slide are gibbed to take up wear, and roller bearings are employed to reduce friction on slide. The table is adjustable for height by means of a screw and nut, for controlling the depth of letter to be marked. Several shelves are provided in the machine for keeping tools and equipment. The machine weighs 370 lbs. and occupies a floor space of 20 in. x 20 in.

### 12-IN. AND 14-IN. QUICK-CHANGE ENGINE LATHES

AN engine lathe of modern design, possessing features which render it suitable for tool room and high-grade manufacturing use, is now being produced by the Mulliner Machine Tool Co., Inc., Syracuse, N.Y., in two sizes—12 in. and 14 in. A high degree of rigidity is imparted to the bed which is cross-ribbed with heavy double-walled cross girths, the casting being made in such a manner that hard, close-grained metal is obtained, so that wear is confined almost entirely to the carriage, which is capable of being readjusted when necessary.

The headstock is of the four-step cone-pulley type, having a forged spindle of crucible steel running in ring oiling bearings, each of which is independently adjustable by taper construction, the front bearing of the 12 in. lathe being  $1\frac{1}{8}$  in. to  $2\frac{3}{8}$  in. x  $3\frac{3}{4}$  in., and the back bearing, 1 13-16 in. to 2 3-16 in. x  $2\frac{7}{8}$  in.

The carriage vees are exceptionally long, while the bridge is of ample width and depth. A box type apron affords double bearings for all important shafts and studs. Full surface contact is provided between the compound rest and the bottom slide, full length taper gibbs with end screw adjustment being fitted to both cross and compound slides.

The quick-change gear mechanism affords 37 different threads and feeds, and is mounted on the front of the bed. The cone gears are cut on the Brown & Sharpe 20 deg. involute system, which produces a tooth with slightly rounded top, permitting instantaneous engagement of the gears. An auxiliary quadrant is regularly provided so that by using extra change gears it is possible to cut all special and metric threads not regularly provided for.

Equipment regularly provided includes compound and steady rests, thread chasing dial, countershaft, large and small face plates and wrenches. Extra equipment includes improved taper and drawing in attachment. The leading dimensions of the 12 in. lathe are: Swing-over bed,  $12\frac{3}{4}$  in.; over carriage,  $7\frac{1}{2}$  in.; standard beds, 4-5-6 ft.; hole through spindle, 15-16 in.; threads cut,  $1\frac{1}{2}$  to 80; feeds, 6 to 320 between centres, 6 ft. bed, 40 in.; net weight, 5 ft. bed., 1,990 lbs.

### OUR NOVEMBER REVENUE

THE greatest revenue month in the history of the Dominion of Canada was the month of November just past. The total revenue for that single month from all sources was equal to the total revenue obtained during the full fiscal year 1879-80. No less a sum than \$23,164,765 was secured during the month of November last.

Canada's revenue for the eight months of the current fiscal year has totalled \$144,912,000, an increase of \$40,156,268 over the corresponding eight months of last year. In November alone, the increase was about \$5,000,000. The increase has been in the main due to customs revenue, which totalled for the eight months \$86,399,557, an increase of a little more than \$26,000,000. Stamp taxes and other special war revenue measures brought in \$6,726,049. Post-office revenue increased by one million, and excise revenue by two millions.

Consolidated fund expenditure for the eight months totalled \$69,567,573, an increase of \$4,222,070; and capital expenditure totalled \$19,954,000, a decrease of \$6,092,437.

War expenditure for the eight months totalled \$146,527,520.

The increase in consolidated fund expenditure is due to the increased interest charges on the public debt. The piling up of the debt due to war cost has already doubled the annual interest charge. For the past eight months the interest on the public debt has been \$15,315,656, as compared with \$7,110,247 for the corresponding period of 1915.

Indications are that for the full fiscal year Canada will be able to pay out of revenue, ordinary and special, between seventy and eighty million dollars of the year's war expenditure of approximately \$230,000,000.

### TORONTO BUILDING RECORD

THE figures issued by the City Architect of Toronto on Dec. 1, for the eleven months ending November 30, 1916, show an increase in the amount of the building permits issued of nearly half a million dollars compared with the corresponding period in 1915. The actual figures show the total business up to November 30, 1916, to amount to \$6,454,823, while the total business for the same period last year was \$5,955,026. The permits issued during the month of November totalled 398, covering work estimated to cost \$948,026, compared with 370 permits amounting to \$799,395 the same month last year. Last month 494 new erections were built compared with 426 in November, 1915.

### ABAF THE BINNAOLE

AN old sailor once appeared to give evidence in a case of assault, when he was asked the following questions:—

The Judge—"Where was plaintiff standing when defendant struck him?"

Witness—"Who are they?"

The Judge—"Don't you know the difference between plaintiff and defendant?"

Witness—"No."

The Judge—"Well, you are a nice chap to come here and give evidence. You don't know the plaintiff from the defendant! Where was he when the man struck him?"

Witness—"Abaft the binnaole."

The Judge—"Abaft the binnaole! Where is that?"

Witness—"You are a fine chap to sit as a judge! You don't know where 'abaf the binnaole' is!"

12-INCH QUICK-CHANGE GEAR ENGINE LATHE.

The genius of the mechanical engineer has cheapened manipulations in the foundry and machine shop; that of the metallurgist, the materials used and produced.

### SENTIMENT NO FACTOR IN POST-WAR TRADE

**T**O buy in the best and cheapest markets, and sell to the best advantage in the same or other markets are sound business principles. Expediency and disability have, however, to be reckoned with, and, relative to our Dominion, the necessary upbuilding of a sound industrial fabric on the one hand, the lack of a merchant marine and in some considerable degree the lack of knowledge of outside requirements and possibilities on the other, militate against practical exposition of such a propaganda either whole or in part. During the past two years, numerous happenings in the prosecution of the war have made stirring appeals to sentiment, with the result that not a few hastily conceived schemes have been publicly suggested and launched concerning future trade relations with our meantime enemies. In a word, the commercial enterprise of the latter was to be circumscribed and restricted, if not altogether eliminated as a world factor. That such an undertaking was too stupendous,—a sheer impossibility fits better, perhaps, because impracticable—has come to be realized, however.

Is a trade war, following that of blood and destruction, inevitable? In some quarters such a contingency is not anticipated, being even flouted. Why, may we ask, shouldn't a trade war be the logical outcome of the other? The world owes neither of the meantime fighting nor neutral nations, in their individuality as such, a living, nor, in the enlarged sense a progressive development. They each owe it to themselves and to the world to shoulder the relative responsibility, and, as in the past, considerable effort will be expended in demonstrating the fact that such is their attitude. War as practised on the battlefields of Europe and on the sea may be hell, yet only does it differ from trade war in absence of harrowing episode and detail, although even these may be evidenced in lesser or greater degree.

Germany, we may rest assured, is going to have and take a place in the Sun following the war of blood, and her intensity of application to the furtherance of her object is likely to be less dependent on peace term detail than we are prone to imagine. Whether the war has had the

like revivifying, yes and revolutionizing effect on her industrial and commercial enterprise as it has had in these directions on the other nations—warring and neutral, we are not in a position to say; this much may, however, be said, that preceding the war, Germany was in many respects an easy leader. We are inclined to think that her pre-war advantage is at least eliminated, and that little evidence of any individual nation monopoly meantime exists.

While Canada, on account of the war, may not have developed a manufacturing capacity to entitle her to rank as a world power, she has made much of the opportunity afforded, and relatively as regards manufactured products her record will bear the keenest comparison. She has nevertheless lagged in industrial and scientific research, in a word, the utilization of waste products and hitherto unused natural resources, the development of new processes—mechanical, electrical, chemical and metallurgical, have been given little attention, and therefore have found but meagre practical application. The establishment of an Advisory Council on Industrial and Scientific Research is announced, and although unnecessarily tardy of creation, may be accepted as "better late than never." Our Minister of Trade and Commerce, Sir George Foster, has been so busy gallivanting, and between times twitting our manufacturers in gallery orations with "being asleep"—even "soundly asleep," when opportunities were knocking at their door, as to allow two and a quarter years to elapse before realizing what were his own responsibilities and duties as well as those of his Cabinet associates.

Much is looked for from the work of this newly appointed Advisory Research Board, even in the making-up of the lost leeway. Our manufacturers are better equipped to make use of both the data and materials available than they are apt to get credit for, and it may not be assuming too much to observe that they will be called upon to both measure up to and successfully overcome the industrial competition of well-nigh a full hand of pre-war German equivalents, quite some considerable time before much research data becomes available. Our metal-working plants in munitions production constituted themselves into research boards and made good. Nothing succeeds like success, and when the pressure of competition begins to be felt in other than war-commodity manufactures, we shall be surprised if history does not repeat itself.

### PAPER STILL SKY-ROCKETING

**J**UDGING by the action of the International Paper Co. in the United States, which controls over 50 per cent.

of the newsprint paper supply there, the cost peak to consumers is still tending towards higher levels. While a more or less substantial advance had been anticipated, effective with the opening of the New Year, publishers were scarcely prepared for an increase from \$2.15 to \$3.10 per hundred, f.o.b. mill on renewal contracts. In every branch of the publishing business the effects of paper shortage and paper cost are much in evidence, the outstanding features being fewer and smaller page issues and increased subscription rates. Just how much more the paper manufacturers' cost to consumer will affect space, quantity and cost to readers is somewhat problematical. It may be that a higher value appreciation of "printers' ink" will be cultivated and developed by and through those among whom its distribution has in the past appeared more or less commonplace.

## INDUSTRIAL NOTABILITIES

**R**UPERT G. BRUCE, vice-president and general manager, Canadian Hanson & Van Winkle Co., Ltd., manufacturers of nickel and electroplating machinery, chemicals and munitions, Morrow Avenue, Toronto, was born in Port Perry, Ont., May 27, 1881, son of Stewart and Isabella Bruce, of Port Perry. He was educated at Port Perry High School and Upper Canada College, Toronto, and began his business career as a clerk in the Construction Department of the C.P.R., Toronto, 1899-1901. He was connected with the Electrical Development Co. (now Toronto Power Co.) from the time of its organization in 1901 until 1907, when he became secretary of the Kennedy

RUPERT G. BRUCE.

Hardware Co., Toronto, 1907-1908. He established the business of Rupert G. Bruce & Co., for the manufacture of electro chemicals in Toronto, 1908-1910; amalgamating same with the Hanson & Van Winkle Co., under the name Canadian Hanson & Van Winkle Co., Ltd., in 1910, of which he is vice-president and general manager. Doctor Herbert Bruce, of the Canadian Overseas Force Hospitals Commission is a brother.

Mr. Bruce served as a private with the Q.O.R. (Upper Canada College), 1908, and went through the ranks until promoted to Captain, 1910, when he joined No. 2 District Staff under General Otter, on which he served for three years as District Signalling Officer. He married Terry Irving, daughter of the late Andrew Irving, March 21, 1908. His clubs are: Toronto, Albany, R.C.Y.C., Lambton Golf, Military Institute; his societies: A.F. & A.M., and recreations: golf and fishing. In politics he is Conservative, and in religion Anglican. His residence is 59 Foxbar Road, Toronto.

bringing the current price to \$8 per ton. The heavy demand for billets and sheet bars continues to tax the capacity of producers and considerable difficulty is still experienced in securing positions on early future delivery owing to the heavy business booked by the mills. Iron and steel bars are very active, the price on the former showing an upward tendency the New York quotation having advanced \$4 per ton. Despite the high prices and distant deliveries, the demand for plates continues very strong, producers working to capacity. The Pittsburgh quotation on tank plates is now \$4.50, an advance on the week of \$10 per ton. Higher prices on rails is looked for in the near future. A general advance in sheet prices has lately been made, and the same condition prevails as in other directions, that is, inability of mills to supply the demand. The advance averages about \$5 per ton, the base for blue annealed, Pittsburg being \$3.75 and on galvanized \$6.25 per hundred, with corrugated 5c per hundred higher. Wire and wire products have undergone a further advance of \$3 per ton, thus raising the base price of nails to \$3 per keg Pittsburg. Wrought iron pipe is in great demand but owing to the pressure on the mills, delivery is quite distant. The situation on the local market is comparatively unchanged with higher prices pending.

## Metals

The general situation is devoid of features and an easier market is the rule. Copper is quieter but continues very firm. Tin is dull and easier. Spelter is fairly active and stronger. Lead is developing additional strength owing to an evident scarcity. Antimony is quiet and aluminum is firm.

**Copper.**—The market is comparatively quiet but sufficient volume is passing to maintain a very strong situation; the general tone indicating a further upward tendency, owing to the heavy inquiry for future positions and the inability of producers to supply the urgent requirements of those consumers who are in need of early metal. While there is no abatement in production and increased facilities are continually being added, the supply is still below the demand and delivery as far ahead as nine months is now being placed. The situation abroad is very strong, being guided more by the tone of the New York market than actual conditions. London prices have improved slightly while the quotations on the New York market are firm on lake, but higher on electrolytic and castings. Local dealers are quoting last week's prices, 37c on lake and electrolytic, and 36c on castings.

**Tin.**—An easier situation is develop-

## The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents

**Montreal, Que., Dec. 4, 1916.**—Increased activity and higher prices continue to be the leading features of the general industrial situation. Indications that future munition work will be still further restricted to purely Ally resources, are expected to have a stimulating effect on Canadian trade generally. Railroad congestion continues and several points are suffering more pronounced inconvenience since the close of navigation.

## Pig Iron

Maximum prices have not been reached yet, additional advances being expected. Inquiries for large shipments,

both domestic and foreign are being constantly received, resulting in a correspondingly unsettled condition. Recent advances range from 50c to \$3 a ton; bessemer and basic coming under the higher figure. Bessemer is now quoted at \$35.95 and basic at \$30.95 advance on No. 2 foundry is about \$28 per ton.

## Steel

No relaxation is noted in the general steel situation and activity is undiminished, with prices on commodities still advancing. Coke continues to be a factor in the high cost of production, the week's advance of \$1 on furnace spot,

## Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department of Trade and Commerce, Ottawa, is able to present the following list of the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

<b>BRAZIL</b> Bahia, British Consul. Rio de Janeiro, British Consul General.	<b>ITALY</b> Genoa, British Consul General. Milan, British Consul.	<b>RUSSIA</b> Moscow, British Consul General. Petrograd, British Consul. Vladivostok, British Consul. Odessa, British Consul General.
<b>CHILE</b> Valparaiso, British Consul General.	<b>MEXICO</b> Mexico, British Consul General.	<b>SPAIN</b> Barcelona, British Consul General. Madrid, British Consul.
<b>COLOMBIA</b> Bagota, British Consul General.	<b>NETHERLANDS</b> Amsterdam, British Consul.	<b>SWEDEN</b> Stockholm, British Consul.
<b>ECUADOR</b> Quito, British Consul General. Guayaquil, British Consul.	<b>PANAMA</b> Colon, British Consul. Panama, British Vice-Consul.	<b>SWITZERLAND</b> Geneva, British Consul.
<b>EGYPT</b> Alexandria, British Consul General.	<b>PERU</b> Lima, British Vice-Consul.	<b>URUGUAY</b> Monte Video, British Vice-Consul.
<b>FRANCE</b> Havre, British Consul General. Marseilles, British Consul General.	<b>PORTUGAL</b> Lisbon, British Consul.	<b>VENEZUELA</b> Caracas, British Vice-Consul.
<b>INDIA</b> Calcutta, Director General of Commercial Intelligence.		

## CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

### CANADIAN TRADE COMMISSIONERS.

### CANADIAN HIGH COMMISSIONER'S OFFICE

<b>UNITED KINGDOM</b> W. L. Griffith, Secretary, 17 Victoria Street, London, S.W., England. Cable address, Dominion, London.
--

ing in tin, owing to reduced consumption. It seems apparent that much of the recent buying of tin has been for the accumulation of safety stocks on the part of consumers; thus resulting in the present quiet state of the market. The situation on the London market is also quieter and quotations have declined, New York is now quoting 45½¢, a drop on the week of ¾¢ per lb. Local dealers report a steady market with prices unchanged at 46¢ per lb.

**Spelter.**—The business for the week has been fairly active, the present condition being firm. The supply of ore has recently been curtailed owing to the scarcity of power at the mines. Further interruptions along these lines, due to the approach of cold weather, may possibly affect the market, and make higher prices probable. A firmer market prevails in London, and New York is ¾¢ stronger, the quotation being 13¼¢ per lb. Dealers here are quoting last week's price of 14¢, but report a higher tendency on a strong market.

**Lead.**—Owing to a shortage in the lead supply, and increased inquiries, a stronger market is developing with quotations stiffening. While the trust price remains unchanged, outside figures have advanced 25¢ per hundred, New York quoting 7½¢ per lb. The local situation is very firm, prices however, being steady at 9½¢ per lb.

**Antimony.**—The market is quiet but firm and the general situation is unchanged. Prices are well maintained at last week's quotation of 15¢ per lb.

**Aluminum.**—No change in the situation with quotations steady at 70¢ per lb.

### Machine Tools and Supplies

Business in the machine tool industry is gradually assuming more normal conditions but sufficient volume is passing to maintain considerable activity, the outstanding feature being the requirements of munition manufacturers. While the bulk of this class of equipment has already been placed, there are always orders for replacements on new lots, in small quantities, being received. Much interest is being centered in the advance in prices in the machine tool lines. However, with the steel industry in its present abnormal condition, these advances are quite natural. The supply situation continues active, but is influenced by the general upward trend of prices.

### Scrap

The scrap situation continues to reflect the upward movement of steel prices and the prevailing strength of metals. Activity is shown in all old metals and advances are noted in the following: No. 1 machine compositions

are now 22¢, turnings 18¢, new brass clippings 18¢, and heavy melting steel 13 cents; these having advanced one cent during the week. No. 1 brass turnings are ½¢ higher, being quoted at 16¢ per lb.

**Toronto, Ont., Dec. 5.**—The industrial situation continues to show steady improvement, due for the most part to substantial war orders, which are increasing in volume as the manufacturers become more familiar with the class of goods required and are able to develop their output. Scarcity of labor and raw materials, however, is restricting capacity production, and the situation in this respect is not showing much indication of any marked improvement. The tendency, unfortunately, is rather the reverse, and it is a difficult problem to solve. Exception, however, may be made in regard to the production of munitions, where the greatest effort is being made

### CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion \$100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the Commission headquarters are at Ottawa.

to increase the output owing to urgent requirements of the situation. Production of munitions during the past few months has shown a substantial improvement, and the industry is on a far more efficient basis than was formerly the case.

### Steel

A shortage of coke is the latest development in the steel trade, and unless immediate relief can be obtained there is a possibility of some furnaces having to suspend operations. The condition is due principally to the shortage of cars, accentuated by the large consumption of coke. The situation is undoubtedly serious, for even if some furnaces have to be banked, the output of steel would, of course, fall off, resulting in a greater scarcity of steel, already sufficiently acute. Every effort is, of course, being made to provide more cars, and it is to be hoped that no serious results will follow, as every pound of steel produced is needed. Prices of steel products continue to climb, helped to some extent by the steady advance in pig iron, but also on account of the extraordinary heavy demand, which is steadily increasing. The market could hardly be firmer, as the

mills have their output sold for practically twelve months, with no sign of any falling off in demand. Both steel and iron bars have again advanced, being now quoted at 3.75¢ and 3.50¢ respectively. Prices of lapwelded boiler tubes are up again for sizes, ranging from 3 ins. to 4 ins. diameter inclusive. Prices are likely to go still higher at an early date, as the mills are largely sold up through 1917, premiums being readily paid on early delivery. The situation in plates is more acute, as the demand is increasing and deliveries are getting more distant. Wire nails have advanced, being now quoted at \$4.35 per keg. Smooth steel wire is 15¢ higher, and is now \$4.70 per 100 lbs., No. 0-9 gauge.

The market for black and galvanized sheets is irregular and prices largely nominal owing to the scarcity of sheet bars and consequent decline in production. Prices of black sheets continue high, and there is little possibility of a decline owing to the high and increasing cost of raw materials, car shortage and scarcity of labor. A further advance from the prices given in the current quotations may be looked for at an early date.

Prices of steel products in the United States continue to advance, and the demand is as strong as ever. Enormous tonnages of material, principally shell steel, are being booked for export. One large steel concern has already booked considerable tonnage for the first quarter of 1918. Steel bars have advanced to 3¢ Pittsburgh. Bessemer and open-hearth billets and open-hearth sheet bars are now being quoted at \$55 per ton Pittsburgh, representing an advance of \$2.50 per ton since last week. Forging billets have advanced \$2, and are now quoted at \$80 per ton Pittsburgh. Chicago warehouse prices on bars, plates, and shapes have advanced \$7 per ton, making bars 3.60¢, plates 4.35¢, and structural shapes, 3.70¢ per pound.

### Pig Iron

Prices of domestic pig iron have been withdrawn pending an improvement in the coke situation. New and higher prices will probably be announced shortly. The market is very strong and the consumption of steel-making pig iron is increasing in tonnage. Practically all U. S. brands of pig iron have made further advances of approximately \$5 per ton. The following are a few which have advanced:—Grey forge, \$28.95, and Bessemer, \$34.45 per ton Pittsburgh; Basic, Valley furnace, \$30 per ton; Lake Superior charcoal iron, \$28, and standard low phosphorus, Philadelphia, \$50 per ton.

### Scrap

The market continues strong, particularly for copper scrap, which has advanced 1¢ per pound. Machine composition, composition turnings, and brass turnings are also higher. Heavy melting

## Whelan Hammer Nosing Apparatus

4.5"      60 Pounders      6" H.E.

**T**HE Whelan Nose Apparatus has been designed with the sole object of giving an absolutely uniform and concentric nose, and at the same time of leaving the inside radius true with the main body of the shell. The shell is held at the base by means of a Collet Chuck, and is revolved by a reversing air motor, which is also used to open and close the chuck.

The carriage travels on plain gibbed ways, and is fed up to the hammer by means of the large pilot wheel geared 3 to 1 into rack on carriage.

The frame is of steel sections, the ways also are of machinery steel, accurately planed.

Our confidence in this apparatus is

justified because in one shop has nosed over 35,000 shells without a spoil or a breakdown.

This method eliminates inside profiling, and the nose of the shell after coming from the hammer, when put in a lathe, runs just as true as the body.

The **WILLIAMS** Machinery  
A. R. Co., Limited

66 Front St. W.

Toronto

steel continues firm at unchanged prices.

### Machine Tools

The outlook in the machine tool business continues bright, and local dealers report satisfactory conditions. A number of inquiries have been received by local machinery houses for machine tools for 4.5 in. and 6 in. shells, in view of further orders for these sizes which are expected to be placed shortly. There is a heavy demand for tool-making equipment, but the supply is light and deliveries very slow. Miscellaneous machinery for ordinary purposes is more active, and the demand is improving. Canadian machine tool builders are exceptionally busy, and have enough orders on hand to keep them busy for many months. The local machinery house which recently purchased a munitions plant in the U. S., is now ready to take orders.

### Supplies

Prices on all machine shop supplies are very firm, and advances have been made on a number of lines. Wood screws have advanced about 12 per cent. Wrenches are about 15 per cent. higher. Stove bolts now carry a discount of 55 per cent., as against 60 per cent. formerly. The Stanley Rule & Level Co. have raised their prices on boxwood rules 10 per cent. Globe, angle and check valves now carry a discount of 30 per cent. for standard quality and 25 per cent. for high grade. Prices of cotton and wool waste have advanced again, white waste being 2c higher, colored  $\frac{1}{4}$ c, wool packing 1c to 4c, and washed wipers 1c, above the old prices. Motor gasoline is unchanged at 25 $\frac{1}{2}$ c, but higher grade gasoline as used by rubber manufacturers has advanced 2c, and is quoted at 33 $\frac{1}{2}$ c per gallon.

### Metals

A firmer tone characterizes the metal markets generally, the principal feature being a further advance in copper, although prices for prompt metal are entirely nominal. Lead is also higher, as was expected, the market being strong on the advance made by the independent producers. The tin situation is unchanged, while spelter is also in the same position. There is nothing of particular importance to note with regard to either antimony or aluminum.

**Copper.**—With practically the entire output of copper sold up for the next six months, it follows that the position of this metal is an exceptionally strong one; in fact, the situation is without precedent in the history of the trade. The demand for copper is as insistent as ever, and is absorbing the entire production of the mining companies. Copper has advanced 1c locally, lake and electrolytic being quoted at 37c, and castings at 36c per pound.

**Tin.**—Prices are firm, but the market is inclined to dullness and buying is less active than during preceding weeks.

Local quotation unchanged at 48c per pound.

**Spelter.**—The market is firm, with a tendency to higher prices. Production has fallen off, due to shortage of power in the principal mining districts, which will tend to stiffen the market. There is a fair demand for spelter, but producers are well booked ahead, and are not anxious to sell. Local prices, 14 $\frac{1}{2}$ c per pound.

**Lead.**—A scarcity of lead for prompt and December delivery has developed, and quotations have advanced. There is a good demand for lead, but the scarcity is restricting sales. The "Trust" is still quoting 7c New York, although independent producers have advanced their prices to 7.40c New York. Lead has advanced  $\frac{1}{2}$ c locally, and is now quoted at 9.50c per pound.

**Antimony.**—The market is firm and steady, with a fair demand. Local price, 18c per pound.

**Aluminum.**—The market is quiet but firm, with quotation unchanged at 68c per pound.

### SHIPYARDS ACTIVE

EXTRAVAGANT claims have been made relating to the tonnage of steel vessels being turned out by United States Shipyards, but the figures given out by the Government as of September 1st this year are striking enough. Nearly-deserted shipyards have sprung into feverish activity.

Thirty-six yards covering both coasts as well as inland ports, report 397 steel vessels now building or under contract, aggregating 1,092,310 gross tons. By far the bulk of this tonnage is pledged for delivery during the current year, ending June 30, 1917. All these vessels are being constructed in privately-owned yards and include only merchant vessels. The naval programme recently adopted, will naturally still further increase the activity of their shipbuilding industry. English shipyards are gradually being made more available to furnish mercantile tonnage, and the latest reports indicate 440 mercantile vessels of all classes under construction, aggregating a little over 1,500,000 tons. While figures are not available, it is reported that German shipyards have their entire capacity contracted for two years ahead.

### SCIENTIFIC SIDE OF CANADIAN INDUSTRIES

AT the recent annual dinner of Toronto Branch of the Canadian Manufacturers' Association, Arthur D. Little, head of a well-known Montreal laboratory, gave an address on "The Relations of Re-

search to Industrial Development." It was a comprehensive resume of the wonders in industry which had followed chemical and other scientific research from the time of the steam engine to the latest electrical or chemical appliance. He attributed the failure of two-thirds of the 250,000 corporations in the United States to failure to utilize scientific results in manufacture.

Among the many things he proposed to manufacturers was the control of quality of raw materials, the finding of substitutes for raw materials unobtainable or difficult to procure, the control of processes, the standardization of product and the reduction or elimination of waste. In some industries, and Mr. Little specified the lumbering industry, the potential values of waste were greater than the values of known products to date.

### PORT OF MONTREAL CUSTOMS AND INLAND REVENUE

BOTH customs and inland revenue receipts for the port of Montreal during November are so high that they are the second largest in the history of the port. The inland revenue receipts of \$1,306,000 were only exceeded in the first month of the war, and last year November had only a total of \$927,779.83.

The receipts for November, 1915, in customs dues, reached only \$2,187,491.04, as compared with \$3,017,253.16 last month. May of this year with a total of \$3,226,108.03, was the largest month in the history of the port. A comparison of the receipts during the months of navigation in Montreal shows a tremendous difference between 1915 and 1916, as the following figures witness:—

May .. ..	\$1,855,000.95	\$3,226,108.05
June .. ..	1,925,575.13	2,827,827.53
July .. ..	1,657,479.20	2,666,150.77
August ..	1,809,775.63	2,815,680.97
September	1,900,774.90	2,779,447.05
October ..	1,674,477.47	2,929,357.20
November.	2,187,491.04	3,017,253.16
	<hr/>	<hr/>
	\$13,010,574.32	\$20,261,824.73

Thus this port, during seven months, has contributed to the revenue of the Dominion Government, \$7,251,250.41 more than during the same period last year.

**Trail Zinc Refinery.**—A large sample of the first bar of commercial zinc produced at the Consolidated Smelting Co.'s refinery at Trail was recently exhibited in Toronto. The metal was pronounced of excellent quality. While the refinery's product is said to be very satisfactory the output of zinc is not yet up to estimates.

## TAPER THREADS EASILY CUT

With a Geometric Taper Threading Die Head one gets the same rapid production and superior finish that mark all Geometric threads. The chasers follow the taper of the work automatically, and release the work at the end of the cut. Head is withdrawn without touching the finished threads.

Geometric Taper Threading Die Heads are adapted to Screw Machine and Turret Lathe. When not cutting taper threads, the Head can be removed, leaving the machine free for other work. Made to order, specially suited to requirements of machine and work. Employed very generally on fuse work. Give the Geometric finish to your taper threads. It will cost you nothing to get our quotation on your specifications. May we have them?

# INDUSTRIAL <sup>AND</sup> CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## Engineering

**Cornwall, Ont.**—The Canadian Cotton Co. will shortly begin the erection of an extension to their mill here.

**Trail, B.C.**—The Consolidated Mining & Smelting Co., is erecting an addition to its electrolytic zinc plant, 165 x 200 ft.

**Edmonton, Alta.**—The Public School Board, will increase the capacity of the school machine shop. F. Brody is secretary.

**Millerton, N.B.**—The New Brunswick Pulp & Paper Co. propose rebuilding their mill, which was destroyed by fire some time ago.

**New Toronto, Ont.**—Brown's Copper & Brass Rolling Mills, Ltd., are building a new sheet mill and a reclaiming plant. The foundations are completed and the buildings are being constructed.

**Vancouver, B.C.**—The Vulcan Ironworks and Schaaque Machine Works propose moving their plants from New Westminster to Vancouver. The Schaaque Machine Works have leased a site on False Creek.

**New Toronto, Ont.**—The Dominion Abrasive Wheel Co., who sold their factory here to the Brown's Copper & Brass Rolling Mills, will build a new factory at Mimico at a cost of about \$65,000. Mr. Sawyer is the manager.

**The Northern Antimony Smelting Co.**, has been incorporated with a capital of \$2,000,000 to operate antimony mines at Lake George, N.B. The property was leased about a year ago by the Canadian Antimony Co., to New Brunswick Metals Ltd. for three years. Later it was rumored that Nova Scotia interests were negotiating for their purchase by new capital.

**Sarnia, Ont.**—It is reported in Sarnia that the Imperial Oil Co. will in the near future start construction work on a new refinery to be erected at Dartmouth, N.S., across the water from Halifax. It is stated that the refinery at Dartmouth will be supplied from fields in Mexico and Texas, and that oil will be brought up in tank steamers. The steamers Iocolite, Royalite, and Sarnolite will operate on the ocean this winter and will return to the lakes in the spring.

**Hamilton, Ont.**—The Canadian Desmon-Stephen Mfg. Co., has been incorporated with a capital of \$50,000, and head offices in Hamilton. It is an American concern, with headquarters at Urbana, Ohio, and manufactures steam ejectors, grinding wheel machinery and such articles. The Canadian Company has opened an office on Market street, and will carry on its Canadian business from there, but for the present will not do any manufacturing in Canada. When it does build, a Canadian factory will be located in Hamilton.

**Trenton, Ont.**—Representatives of the Imperial Munitions Board, Ottawa, have a staff here overseeing the erection of about 60 buildings on a site of 140 acres, on the east side of the Trent River, and on property formerly owned by Gilmour Doon Co. and the Gilmour Lumber Co. The Gaylord Engineering & Construction Co., of Scranton, Pa., and Binghamton, N.Y., have about 400 men at work erecting 28 buildings, and the Pratt Engineering Co., of New York, are preparing to erect as many more, and there is another contract for more buildings under consideration. The plant will be operated by the British Chemical Co., which has recently been incorporated at Ottawa.

## Municipal

**Brantford, Ont.**—The Town Council contemplate installing a water filtration plant.

**Dartmouth, N.S.**—The Town Council propose making extensions to the water and sewerage systems, at an estimated cost of \$6,800.

**Hepworth, Ont.**—It is proposed to submit a by-law to the ratepayers in the near future to authorize the installation of an electric light and power plant.

**London, Ont.**—The City Council has decided not to submit the proposed by-law to spend \$20,000 on the municipal paving plant, but to take a plebiscite at the January elections.

**Whitby, Ont.**—The ratepayers on Monday voted against the proposed agreement with the Canadian Tractor Co., the by-law being defeated by an adverse majority of 102.

**Hamilton, Ont.**—By-laws will be voted on at the January elections to

raise \$5,869,286 for a hydro-electric radial from Port Credit to St. Catharines and \$362,500 for new pumps.

**Port Arthur, Ont.**—The citizens will vote at the January elections on a by-law to authorize a contract with the Hydro-Electric Commission to develop, construct and acquire Dog Lake Power. It is estimated that about 30,000 h.p. will be developed.

**North Bay, Ont.**—By-laws will be voted on by the ratepayers on Dec. 11, to grant a \$15,000 loan and \$5,000 bonus to the Dominion Rubber Cloak Co., Toronto; also free site and building, not to cost more than \$15,000 to the North Bay Toy Co.

**Fort William, Ont.**—In the event of the City Council favoring the development, of power at Dog Lake, they will be asked to submit a by-law to the ratepayers, the idea being to make Fort William a partner with Port Arthur in the proposed hydro development.

**Elmira, Ont.**—A by-law was submitted to the ratepayers of Elmira on Dec. 1, to grant certain concessions to the Consolidated Rubber Co., to establish a branch factory here. The proposal practically carried unanimously, only seven votes being cast against it.

**Chatham, Ont.**—Ratepayers will be asked at the January elections to endorse debentures to the extent of \$45,000 to provide for extensions that have been made and are being planned to the Chatham Hydro system. A large increase in customers from 600 to 1,350, has also been responsible for a large share of the increase.

## Building Notes

**Toronto, Ont.**—It is proposed to erect a new Masonic Temple at the corner of Davenport Road and Yonge Street to cost about \$200,000.

## Tenders

**Toronto, Ont.**—Tenders will be received, addressed to the chairman, Board of Control, City Hall, Toronto, up to January 16, 1917, for the installation of a 40 million Imperial gallon centrifugal sewage pump at the main sewage pumping

station, Toronto. Specifications and forms of tender may be obtained at the Works Department, Room 6, City Hall.

**Winnipeg, Man.**—Tenders addressed to the undersigned will be received up to December 18, for the construction of 9½ miles of 5 ft. 6 in. reinforced construction pipe. Plans, specifications and form of tender can be secured on application to the district Commissioners accompanied by certified cheque for \$20. R. D. Waugh, chairman of Winnipeg Water District Commissioners, 901 Boyd Building, Winnipeg.

**Ottawa, Ont.**—Tenders will be received up to January 15, 1917, for the construction of a reinforced concrete lighthouse tower and fog alarm building combined, and a wooden dwelling at Point Abino, Township of Bertie, Welland County, in the Province of Ontario. Plans, specifications, form of contract and schedule of wages, can be seen, and forms of tender procured, at the Department of Marine, Ottawa; at the Harbor Master's Office, Toronto, and at the post offices, Welland, Port Colborne, St. Catharines, Bridgeburg, Hamilton and Brantford.

## General Industrial

**Bracebridge, Ont.**—The Beacon Match Co. proposes to erect a plant here to cost \$45,000.

**Delhi, Ont.**—The Sovereign Co., mitt and robe factory was destroyed by fire on Dec. 1. Bruce Whitehead is the manager.

**Port Arthur, Ont.**—The mayor and city clerk have been authorized by the City Council to sign an agreement with James Richardson & Sons, who propose to build an elevator in Port Arthur. The elevator will cost about \$700,000.

**New Toronto, Ont.**—Work has been started on the erection of a factory building here, for the Dupont Fabrikoid Co. of Toronto, manufacturers of leather goods. The building will cost \$75,000 and machinery to cost \$175,000 will be installed.

## Personal

**C. E. Kennedy**, manager of the A. R. Williams Machinery Co., of Vancouver, Ltd., is visiting Toronto for a few days on business.

**Norman S. Thresher**, who recently joined the staff of the Western Dry Dock & Shipbuilding Co., Port Arthur, Ont., has assumed the position of pur-

chasing agent for the company in the United States, with office at 350 Rockefeller Bldg., Cleveland, Ohio.

## Railways—Bridges

**Oakville, Ont.**—The ratepayers will vote on a Hydro-Radial by-law at the municipal elections on New Year's Day.

**Hamilton, Ont.**—The proposed cost of the Hydro-Radial System for Clinton township is placed at \$473,746, and for Beamsville at \$51,469.

**St. Catharines, Ont.**—The Township Council of Louth on November 27 gave two readings to the Port Credit-St. Catharines Hydro-Radial by-law and passed it on to a vote of the ratepayers on New Year's Day. Louth's share of the cost will be \$553,000.

## New Incorporations

**The Canadian Foundry & Machine Co.**, of Calgary, Alta., has been incorporated with a capital of \$100,000.

**Canadian Aeroplanes, Ltd.**, has been incorporated at Ottawa, with a capital of \$500,000, to manufacture aeroplanes, sea-planes, etc., at Toronto. The incorporators are R. H. Parmenter, A. J. Thomson, and William S. Morlock, all of Toronto.

**Universal Asbestos Co.** has been incorporated at Ottawa, with a capital of \$50,000, to manufacture asbestos products of all kinds at Sherbrooke, Que. Incorporators are Harry R. Fraser, F. Samuel Rugg, and H. M. Terrill, all of Sherbrooke.

**Bala Electric Light & Power Co.** has been incorporated at Toronto, with a capital of \$25,000 to operate an electric power plant at Bala, Ont. The provisional directors are John P. Weeks, Gordon B. Jackson, and A. G. Tudhope, all of Bala, Ont.

**The Wax & Glassine Paper Co.**, has been incorporated at Ottawa, with a capital of \$225,000, to manufacture pulp and paper, and pulp products, at Cookshire, Que. Incorporators are Robert A. Pringle, Thomas A. Burgess, and Louis Cote, all of Ottawa.

**International Mfg. Co.**, has been incorporated at Ottawa, with a capital of \$1,000,000, to manufacture munitions of all kinds, with head office at Ottawa. The incorporators are John A. Harriss, Rufus L. Patterson, and Alfred O. Hoyt, all of New York city.

**The Sault Shipping Co.** has been incorporated at Ottawa, with a capital of

\$300,000, to build and operate steamships, with head offices at Sault Ste. Marie, Ont. Incorporators are Alex. Taylor, Rex E. Nicholson, and Joseph E. Gibson, all of Toronto.

**Canada Truck Co.** has been incorporated at Ottawa, with a capital of \$4,900,000, to manufacture automobiles and motor trucks, etc., with head office at Montreal. Incorporators are Richard E. Harman, John W. Blair, and Francis Y. Laverly, all of Montreal.

**The D. Burtch Mfg. Co.** has been incorporated at Ottawa, with a capital of \$50,000, to manufacture dairy and farming machinery, with head office at Toronto, Ont. Incorporators are James McMillan, Delbert Burtch, and Rupert K. Grinshaw, all of Toronto.

**Kenyon Copper Mines, Ltd.** have been incorporated at Toronto, with a capital of \$1,250,000, to acquire and develop mineral lands and deposits, with head office at Toronto. Provincial directors are Kenneth F. Mackenzie, Arthur L. Reid, and H. A. Thompson.

**Hudson Copper Co.** has been incorporated at Toronto, with a capital of \$2,000,000 to acquire and develop mineral lands and deposits, with head office at Thessalon, Ont. Provisional directors are Robert H. Wilson, Robert E. Laidlaw, and Edgar & Raney, all of Toronto.

**The Central Development Co.** has been incorporated at Ottawa, with a capital of \$250,000, to acquire and develop oil and natural gas properties, with head office at Chatham, Ont. Incorporators are R. L. Pattinson, William G. Ryan, and Edgar Raney, all of Toronto.

**Canadian Mining Corporation, Ltd.**, has been incorporated at Ottawa, with a capital of £1,660,000, to carry on the business of a mining, milling and reduction company, with head office at Toronto. The incorporators are Kenneth D. Mackenzie, W. Walter Perry, and Charles H. C. Leggott, all of Toronto.

**Bissel Carpet Sweeper Company of Canada, Ltd.**, has been incorporated at Ottawa with a capital of \$100,000, to manufacture carpet sweepers and vacuum sweepers at Niagara Falls, Ont. Incorporators are Willis B. Sturup, James W. Bicknell, and Aubrey T. Maher, all of Toronto.

**The Canadian Desmond-Stephen Mfg. Co.**, has been incorporated at Ottawa with a capital of \$50,000, to manufacture automatic steam injectors and ejectors, abrasive wheels and grinding machinery at Hamilton, Ont. The incorporators are A. Hope Gibson, Gabriel H. Levy, and Charles H. Higgins, all of Hamilton.

## Marine

**Sarnia, Ont.**—A new iron range light showing the way into the St. Clair River from Lake Huron is now being erected. The light will be constructed of steel, and will replace the wooden structure destroyed when the Port Huron and Duluth Steamship Line freight sheds were burned.

## Wood-Working

**St. Stephen, N.B.**—Haley & Sons are in the market for woodworking machinery for their new factory.

## Contracts Awarded

**London, Ont.**—The Dominion Government has awarded a contract to M. J. Hogan of Port Burwell for the construction of a new concrete pier protecting the west side of Port Stanley harbor. The contract price was \$135,000 and the work will be undertaken early in the spring.

## Trade Gossip

**The Roelofson Elevator Works** of Galt, Ont., have been awarded a contract for a freight elevator to be installed at the Canada Starch Co. plant, Fort William, Ont.

**Montreal, Que.**—It is reported that the Canadian Car & Foundry Co. and the Canadian Steel Foundries, Ltd., have been awarded a contract for forgings to the value of approximately \$14,000,000.

**Open Regina Branch.**—G. E. Carpenter, Winnipeg, secretary of the Canadian Manufacturers' Association, reports that a Regina section has been inaugurated, with J. P. Cook, of the North-West Iron Works, as chairman.

**Connaught Tunnel Open.**—The Connaught tunnel, between Rogers' Pass and the Glacier, in the Rockies, which eliminates a very steep grade on the C. P. R. and renders unnecessary a large system of snow sheds, was opened for traffic on Friday.

**Merritton, Ont.**—The Riordon Pulp & Paper Co. recently commenced the production of bleached sulphite at their Merritton mill. The first run was of a very excellent quality, according to the management. The demand for this kind of sulphite pulp is very much in excess of what can be supplied just now.

**Insured Navigation Has Closed.**—Lake navigation—that is, regularly in-

# Subscriptions. Invited From Friends Abroad

*Canadian Machinery and Manufacturing News* is published weekly. Representing, as it does, the industrial life and activities of Canada, it should prove of very considerable value to those who wish to buy Canadian products, and to those who may wish to sell in Canada.

As a technical journal it compares very favorably, we think, with any other high-class publication, and will be found to be well worth the subscription price, and more.

If you are favorably impressed with this number, we think you will find other issues equally interesting. *Canadian Machinery* contains from eighty to one hundred and twenty pages—fifty-two issues in the year. We invite subscriptions from our friends abroad, and attach a coupon for the sake of convenience.

## Subscription Order Form

To the Publishers,  
CANADIAN MACHINERY,  
143 University Ave.,  
Toronto, Canada.

Gentlemen,—

You may enter our subscription to CANADIAN MACHINERY for one year, and until ordered discontinued, to be sent to address below. We enclose money order covering same.

Yours truly,

Name .....

Full address.....

City..... County.....

The subscription price to Great Britain and her colonies is 12s. 6d. United States, \$3.50, other countries 16/- per year.

sured transportation—closed on Nov. 30, but managers of fleets with Duluth connections say pressure for iron ore down the lake is reported so great that shipments probably will continue until the ice stops boats there or at the Sault. Even January 1 is set as the final stoppage of all boats on Lake Superior, ice permitting.

**The Ohio Iron & Metal Co.**, of Chicago, Ill., dealers in iron and steel scrap, have opened a branch office at 505 Transportation Building, Montreal, in charge of John M. Zehner, formerly with the Canadian Fairbanks-Morse Co. The Ohio Iron & Metal Co. also have branch offices in Pittsburg, Cleveland and St. Louis.

**Shipbuilding to Foreign Account.**—In the British House of Commons on Nov. 30, Chiozza Money inquired if Vancouver and Montreal shipyards, were building cargo steamers for Norwegian account; if it was in the national interest for British colonial yards to build ships for neutrals when it was so difficult for British shipowners to get deliveries. Bonar Law replied that the Government was communicating with Ottawa on the subject.

**New English Electric Steel Furnace.**—The Greaves-Etchells electric steel furnace is the name of a new type designed by two Sheffield engineers to meet the requirements of the Sheffield steel industry, according to the *London Iron and Coal Trades Review*. Its construction has now been taken over by the Furnace Construction Co., of Sheffield and a dozen such furnaces are being negotiated for. The new furnace uses 3-phase current, but only two top electrodes.

**Shortage of Coke.**—Officials of the Steel Company of Canada, Hamilton, stated on Friday that operations of that concern would be brought to a temporary stop owing to coke shortage. The plant is running under reduced tonnage in the hope that relief will come without closing down, but owing to the scarcity of coal cars and the heavy movement of coal from the mines to the lower lake ports, no improvement of the situation is anticipated until navigation closes.

**Ontario Labour Bureau.**—A good record was established by the Ontario Government Public Employment Bureau in the first week of its existence. A statement was given out on Saturday by Dr. Riddell, Superintendent of Labour for Ontario covering applications received up to Friday as follows: Number of applicants for munitions work in Toronto to date, 374, made up as follows: Married women, 164; single women, 153; widows, 51; deserted 6. The age limit of the applicants was: In teens, 28; in twenties, 117; in thir-

ties, 124; in forties, 68; in fifties, 13; in sixties, 1; omitted to give age, 23. The number to seek work in factories was 158; already in munitions factory, 55; new workers, 58, house workers, 41, shops, 28; professional women of different kinds, nurses, and teachers, 10; office, 16. Of the applicants those willing to go out of town numbers 52; would go out of town, but prefer to be in Toronto, 21; Government inspectors, 23; matrons, 10.

**British Firms Order Canadian Metals.**—The value of the work which is being done by the Commercial Intelligence branch of the Trade and Commerce Department, Ottawa is illustrated in the result which has followed the publication by the Department of one inquiry from a British firm, asking for Canadian metals. A Montreal company answered the inquiry and received an order immediately amounting to \$123,000, followed soon after by a second order amounting to \$427,000 making a total of \$550,000 in three months.

**B.C. Shell Orders.**—British Columbia munition plants have just received orders calling for the manufacture of 30,000 18 pdr. high explosive shells per week for the first half of next year. Practically all of the Coast machine shops were operating double shifts on the same class of shell up to the end of August. The contracts above mentioned will amount in value to over \$1,250,000. Twelve thousand of the new shells will be produced weekly in Vancouver, ten thousand in New Westminster, and eight thousand in Victoria. The Vancouver Engineering Works will handle the bulk of the Vancouver order.

**To Pool Lumber Exports.**—The lumber exporting interests of British Columbia on Nov. 30, perfected an arrangement which they are confident will shortly restore the provincial lumber export trade to substantial proportions. With one exception all the mills have agreed to consolidate or pool their output for export, which will be handled by the Canadian Trading Co., and organization incorporated in the province some time ago. Through its connections in London and San Francisco, the Canadian Trading Co. is able to guarantee tonnage for lumber shipments within a very short time, and it also has chartered all the vessels now being built in British Columbia yards for the lumber trade, with one exception.

**Toronto Labor Bureau Record.**—One thousand and fifty-six persons supplied with positions during November is the record of the Toronto Civic Labor Bureau. It constitutes a new high-water mark for this department, which

is under the direction of the Property Commissioner. It is all the more remarkable because there have been no large orders for men during the month. All but sixty have been placed in factories in the city. As compared with last month's figures, 602 positions were filled in October and 560 in September. Commissioner Chisholm accounts for the increase by the fact that there has been a large influx of men looking for factory positions from all parts of the country. Every province in the Dominion is represented in last month's list. That a number of Chinese were among the applicants is evidence that there was also a fair sprinkling of different nationalities on it.

**World's Output of Graphite.**—Interest in graphite at present is widespread. According to the Canadian Mining Institute Bulletin the two principal forms in which the mineral is found are amorphous and crystalline, the former being very common. The world's production statistics for 1912, the latest available, are as follows:

	Tons
Ceylon .....	36,660
Canada .....	2,060
South Africa .....	42
Austria .....	50,017
Madagascar .....	3,011
United States .....	3,835
Mexico .....	3,158
Korea and Japan .....	8,363
Germany .....	13,814
Italy .....	14,517
Sweden .....	87
Norway .....	285
France .....	661
<b>Total .....</b>	<b>136,510</b>

**Paper Companies Merge.**—By the completion of a merger between the Bryant Paper Co., of Kalamazoo; the Oxford Paper Co., of Rumford Falls, Maine, and the Partington Pulp and Paper Co., of St. John, N.B., the latter corporation, with its extensive pulp plants passed to the control of the American companies. The sum of \$3,500,000 is estimated as the cost of the deal. The new company will be known as the Nashwaak Pulp and Paper Co. and will maintain its head office in New York City. The following officers were elected: President, P. J. Chisholm, St. John, N.B.; Vice-president, L.M. Bickford, New York; Treasurer, F. E. Tufts, St. John; Secretary, H. H. Drummond, St. John.

**Montreal, Que.**—It is understood that the Sherwin-Williams Co., propose erecting a large plant for the manufacture of dyes, after the war. The plant is destined primarily to capture a portion of the dye trade formerly

### An Ideal Locker for Clothes and Personal Tools

This combination Tool and Clothes Locker will be very useful to the mechanic because it provides ample space for clothes and a safe place for his tools.

Built for life-time service. Supplied in unit or group construction.

## Saving or Wasting?

The manner in which you handle the drinking water problem in your plant may seem to be a small matter to you—but investigate. The results will be surprising.

The old-time faucet is costly. Running hour after hour, day after day, its ceaseless flow is costing you money, yet without any better service.

## Puro Saves 35%

A Puro Sanitary Drinking Fountain will cut that water bill 35%. We can prove that it has done that for others.

It will give every employee a safe, saner draught of bubbling water free from the contamination of the common drinking cup.

In a word, it is the only sanitary Drinking Fountain that is really safe, sanitary, simple, automatic in control, and easy to attach.

## QUANTITY PRODUCER

This tool is used in shops where parts are keyseated by thousands. It is fitted with a high-speed steel rotary cutter for milling internal keyseats in one cut. Shops large and small can use the tool, and it is readily attached to a drilling machine for which it is designed. The tool keyseats in places where Keyseating Machine, Planer and Shaper can't reach. The right tool to use for keyseating interchangeable parts. There is no limit to the variety of work possible to be keyseated.

held by Germany throughout the British Empire. It is stated that the trade of Canada alone in this respect would not warrant the building of a factory. Ultimate capacity will, of course, depend upon a satisfactory tariff, which now seems assured. Canadian supplies at present come largely from the U.S., and this branch of trade has been found to be so important that the company is even now erecting in Chicago a large plant. This will supply the Canadian needs of the company until such time as a plant is built here. The company is at present manufacturing a complete line of colors in connection with its paint plant, having started with two lines only. The product has been found so satisfactory as to lead to the decisions referred to.

## Catalogues

**Horizontal Boring Machines.**—Catalogue illustrating and describing three types of horizontal boring and milling machines made by Webster & Bennett, Ltd., Coventry, England. The catalogue contains a specification covering each type of machine accompanied by a table giving the principal dimensions and shipping weight for each size. Particulars of extra attachments are also given. The illustrations are full page and show clearly the general design of each type and the different styles included in the various types of machines.

**Multiple Drilling Machines** made by Webster & Bennett, Ltd., Coventry, England. This catalogue describes and illustrates a varied and an interesting line of multiple drilling machines, including gang drilling, multiple, two and four spindle drilling machines. Also two and four spindle tapping and boring machines, while sensitive drilling machines are also described and illustrated. A specification is included for each type of machines accompanied by a table giving the principal dimensions and other particulars.

**Arc Lamp Carbons.**—The Electrical Engineering & Equipment Co., London, England, have issued a new catalogue, A. B. 1, dealing with an extensive line of arc lamp carbons, carbon brushes, battery carbons and other similar products. Among the arc lamp carbons listed is a special line for cinematograph work, of various qualities. As the carbon brushes are made in various grades, a summary of brush characteristics is given for each grade with remarks stating the class of work for which each is best suited. In this connection there are also a series of characteristic curves and particulars covering the various grades. Other carbon products listed, include brushes for

special work, plates, rods, blocks, contacts, carbon tubes, etc. The catalogue is fully illustrated and contains nine complete price lists.

**Cushman Chucks.** — The Cushman Check Co., Hartford, Conn., are distributing to the trade their 1917 catalogue containing new list prices adopted in August of this year. The catalogue features an interesting and extensive line of chucks and portable face-plate jaws. In addition to the prices, a brief description is given of each type of chuck, while tables are included, giving the principal dimensions for each size. The catalogue is fully illustrated.

**Gold Metal Sawing Machines** made by the Newton Machine Tool Works, Philadelphia, Pa., Catalogue No. 51, just off the press, briefly describes the company's latest designs and sizes of cold metal sawing machines and also some of prominent designs and sizes of other machines which they manufacture. A general specification is included for the cold saw machines, and there are also dimension tables giving the principal dimensions and capacities of the various sizes. The other machines dealt with include various types of milling, slotting, planing and boring machines. In this section of the catalogue the principal dimensions of each type of machine are also given. The catalogue is fully illustrated and well gotten up, the half-tones being unusually distinct.

## Book Review

The Canadian Trade Index for 1916-1918, compiled and published by the Canadian Manufacturers' Association, Inc., Toronto, price \$5. In the latest edition of this publication a number of new ideas have been embodied and the value of the book considerably enhanced. Two features have been added in this edition, which will be of great convenience to the users of this book. The first of these is a continuous alphabetical list giving the correct name and address of every manufacturer appearing in the classified section, together with the various lines, branches, export representatives, etc., of the firms where this information has been available. In the second feature the French index of headings has been supplemented by the addition of the English headings, which appear in alphabetical order in the classified section. In this edition a large number of changes have been made in former headings to make them more descriptive and more easily found. Over two thousand new headings have been added and the names of firms appearing in this index for the first time number between two and three thousand, making a total of 7,500.

Steel Shell Forgings or Billets of any size or weight will move any distance or about curves upon our specially constructed Gravity Carriers and Incline or Horizontal power devices. No labor required.

without tank, 94 feet high. Will support tank  
holding 13,000 gallons. Cost new \$1,600.00.  
Will sell for \$350.00 f.o.b. Shawinigan Falls,  
P.Q. Northern Aluminum Company, Limited.

## Wanted

### A Photographer

Young man with experience  
in photographing machin-  
ery. One possessing techni-  
cal education preferred. A  
knowledge of advertising  
would prove valuable. When  
applying, give full particu-  
lars re experience, age,  
where employed now, salary  
expected. Splendid opening  
for hustler. Replies will be  
treated in strictest confi-  
dence. Address Box 249,  
Canadian Machinery.

**BRASS RODS, 1¼, 1½, 1¾ UP TO TEN FT.**  
Brass tubings, 2¾ o.d., with ¼ wall; all  
lengths to ten feet. Louis Lovitz, 186 Mark-  
ham St., Toronto. Telephone College 5711. (17)

**FOR SALE—TWELVE H.P. GAS OR GASO-**  
line Engine. Gould, Shapley & Muir Ideal.  
In first-class condition. Cheap. Stedman  
Brothers, Ltd., Brantford, Ont. (21)

**FOR SALE—FIVE THOUSAND FEET OF 1"**  
black piping. Newell Mfg. Co., Prescott,  
Ont. (18)

**BAND SAW—COWAN & CO. MAKE, 30"**  
Iron Frame. Post Machine 29½" x 33".  
Iron Tilting Table and Saw Guard, including  
Brazing Tools; setter for Filing, etc., has had  
very little use. Whaley, Royce & Co., Limited,  
227 Yonge St., Toronto, Ont. (28)

**WE CAN GIVE EARLY DELIVERY ON**  
difficult fixture cutting, also on gauges and  
jigs. We have a large shop and the finest  
equipment. Apply Box 235, Canadian Machin-  
ery.

**FOR SALE — IMMEDIATE SHIPMENT —**  
New Heavy Duty Shell Boring Lathe for  
manufacture of 6" High Explosive Shells. Write  
for complete specification. Wm. Hamilton Co.,  
Ltd., Peterboro, Ont. (20)

**1-2SPINDLE SHAPER, WOOD TOP, JOHN**  
Ballantyne, Preston, make, used two months.  
1 Dynamo, 45 lights, Toronto and Hamilton  
Electric Co. make. Used five months. Good  
as new. Box 195, Jordon, Ont. (R.T.F.)

**FOR SALE—1 40 H.P. ROBE, ARMSTRONG**  
high-speed engine; 1 4 x 1 Marsh deep well  
steam pump, and 1 Barton generator, 80 lamp  
capacity, with switch-board. All in good or-  
der and cheap for quick sale. Richards-  
Wilcox Canadian Co., Ltd., London. (20)

**FOR SALE.—ONE BROWN-BOGGS MARK-**  
ing Machine, suitable for 6" Mark XVI. or  
Mark III, English Shells. Only object in sell-  
ing is that other methods of marking have  
been adopted. Price on application. Taylor-  
Forbes Co., Ltd., Guelph. (14)

**1 VERTICAL, SINGLE ACTION, DOUBLE**  
cylinder hydraulic pump, 6" stroke, all  
ready to connect up; almost new; price \$75.  
McGregor & McIntyre, 1139 Shaw Street, To-  
ronto. (1f)

**FOR SALE—FIFTEEN HEAVY CAST IRON**  
columns, from thirteen to seventeen feet  
long. Columns tapered and have good heavy  
base and top. Also four roof trusses, sixty  
feet long. Ten feet in centre, eight foot at  
ends. Will cut columns to suit purchaser.  
Woodside Bros., Port Arthur, Ont. (2)

## WANTED

**WANTED — BORING MILL, 30" TO 42"**  
table; state make, condition, time used,  
lowest price, and send cut to Winnipeg  
Machinery Exchange, Sutherland and Glad-  
stone Sts., Winnipeg, Man. (21)

**WANTED — THREE TURRET LATHES**  
suitable for steel sockets, also Thread  
Millers suitable for milling outside thread of  
sockets. Give price and particulars to Steel  
Furnishing Co., New Glasgow, N.S. (19)

## SITUATIONS WANTED

**SUPERINTENDENT, DESIROUS OF**  
change, 18 pdr. shrapnel, and 6" H. E.  
shells. Box 247, Canadian Machinery. (26)

**EXPERT FOUNDRYMAN FAMILIAR**  
with all modern foundry appliances, de-  
sires position as foreman or assistant in  
gray or malleable iron foundry. Box 250,  
Canadian Machinery. (25)

**COMPTROLLER, OFFICE MANAGER,**  
chief accountant, credit man, executive  
ability. Twenty years' experience. Now hold-  
ing responsible position. Desirous negotiat-  
ing with large manufacturing industry offer-  
ing good future prospects for equal services.  
Address Box 244, Canadian Machinery.

**SUPERINTENDENT WITH PROVEN ME-**  
chanical and executive ability desires  
position as same, or one of equal grade. Wide  
experience with well known firms manufac-  
turing high explosive shells, rifles, electrical  
machinery and instruments, light and heavy  
sheet metal and plate products. Have satis-  
factorily supervised installation and organ-  
ized new plants for widely varied lines of  
product. Address P.O. Box 122, Dartmouth,  
Nova Scotia. (25)

## SITUATIONS VACANT

**FIRST CLASS GRIDLEY AUTOMATIC**  
men wanted to set up Gridley automatic  
machines, also operators for same, highest  
wages paid, only first class mechanics need  
apply. Apply 47 Richmond St. East, Toronto.  
(24)

**WANTED—NIGHT SUPERINTENDENT TO**  
take charge of factory making 4.5 sockets.  
Apply Box 237, Canadian Machinery.

**FOREMAN TOOL-MAKER WANTED — TO**  
take charge of tool room in plant manu-  
facturing 4.5 sockets and other munition work.  
Apply Box 256, Canadian Machinery.

**WANTED — EXPERIENCED STEEL**  
works draftsman for Nova Scotia. Give  
full particulars, including salary, permanency.  
Apply Box 234, Canadian Machinery. (17)

**ALL-ROUND MACHINISTS WANTED FOR**  
tool-room; highest wages paid. A. R.  
Ormsby Co., Limited, 48 Abell Street, Tor-  
onto. (21)

**WANTED — FIRST-CLASS MACHINIST**  
able to take charge of our repair shop.  
Apply Hull Iron & Steel Foundries, Ltd.,  
Hull, Que. (23)

**MECHANICAL DRAUGHTSMAN WANTED**  
for tracing and detailing on general machin-  
ery work, also opening for man with experi-  
ence on plate and structural work. Box 245  
Canadian Machinery. (23)

**SPLENDID OPPORTUNITY FOR YOUNG**  
man about twenty-one, well educated and  
with some mechanical knowledge, who desires  
to learn the machinery business. Apply in  
first instance with full particulars as to ex-  
perience, etc., to Box 243 Canadian Machinery.

## REPAIRING

**ALL KINDS OF MACHINERY REPAIRED,**  
rebuilt and installed. W. H. Sumbing Mach-  
inery Co., 643 Yonge Street, Toronto, Ont.

# High Explosive Shell Manufacture

Staff Article

*The equipment, methods and devices, employed in the machining of the larger and more powerful types of high explosive shell are given practical exemplification in the accompanying article. It will be easily noticeable and appreciated that weight and structural rigidity as regards the former, and high degree display of ingenuity with respect to the latter, constitute the essentials of successful production achievement. The experience of the plant under review bears out the inference so drawn, to quite a remarkable extent.*

## MACHINING 9.2-IN. SHELL

WITH the production of the smaller sized shells on a well-established manufacturing basis, attention is for the most part being centered on the developments towards an equally satisfactory state of affairs as regards the larger types. With the knowledge gained from previous experience, the progress record on the larger shells is comparatively rapid. Owing to heavier weight and increased dimensions,

## Cutting-off and Centering

In the machining of the 9.2 in. shells, it is always advisable to commence working from the rough bore of the forging, as this portion offers the greatest difficulties for accurate tooling operations. If this practice is not adhered to, the possibilities of trouble are numerous. The first operation on the shells after they are received in the shop, is to try out and lay off the centre on the nose end; and as the accuracy of

point that will coincide with the central line of the rough bore. To accomplish this, the shell is placed upon a large mandrel that is secured to a heavy surface plate in a horizontal position. This mandrel is somewhat smaller than the bore, and is provided with a bolt in the outer end to prevent the shell riding up on the inner nose profile. When the shell is in position, the end is marked with chalk, and by means of a surface gauge, lines are scribed across the end, the shell being turned through an angle of 90 degrees as each line is marked.

The first machining operation is to cut off the open end, which is performed in three Williams Tool Co. cutting-off machines. Two tools are used, that at the rear being V-shaped, 5-16 inch wide, and the front one being  $\frac{3}{8}$  inch square nosed. Drilling and countersinking for the lathe centre is the next operation,

FIG. 1. DETAIL OF CENTERING JIG ATTACHED TO BASE OF "BARNES" DRILL.

methods and devices employed vary considerably from those in vogue for the smaller sizes.

the subsequent machining depends very largely upon this preliminary work, much care is exercised in obtaining a

and it is essential that the drilled hole should be placed in the exact position, as it would be very difficult to alter it

FIG. 2. FINISHING BODY AND ROUGHING PROFILE ON "NILES-BEMENT-POND" (BERTRAM) HEAVY DUTY LATHE.

afterwards. The fixture used for this purpose is secured to the base plate of a Barnes drill and is shown in Fig. 1. The frame A which is secured to the base plate, carries the tilting piece B, in which is secured the centre post C, upon which the shell is placed. Threaded to the upper end of this post is the three point steel cap D that bears upon the inner profile of the shell. In the lower end of the post, a chamber is provided for the wedge pin E, which operates the three blocks F, used in centering the base of the shell; the vertical motion of the wedge pin being controlled by the piece G, secured to the end of the foot treadle H. When the treadle is pushed down, it is locked in position by means of the spring bolt K, held in the bracket L. To retain the fixture in a central position the spring pin M, is provided.

To remove the shell from the jig, the pin M, is disengaged, and the central portion revolved on the trunnions by means of the rod O, and, when in a

FIG. 1. FORGING SIZES FOR 9.2 IN. HOWITZER SHELL.

horizontal position, the pins P, operated by the lever Q and the link R, engage with the two holes S, one on either side. On one side of the fixture is an angle

FIG. 4. DRILLING OUT NOSE OF SHELL ON A 6 FT. "C.M.C." RADIAL DRILL.

iron framework T that supports a number of brackets U, carrying cast iron rollers V, that facilitate the placing or removal of the heavy shells. The bolt W is to aid in locating for central position. Secured in either side of the main frame casting are the two rods carrying the cross bar Y, in which are the drill bushes. Two of these are employed, one for the drill and the other for the countersink. By using the try-out centering method previously described, the inside parallel portion is checked with the contour for concentricity.

#### Outside Turning and Nose Drilling

After the centre has been put in the nose, the shells are taken to the lathe for outside turning. This operation is performed on seven Niles-Bement-Pond, and two Canadian Fairbanks-Morse heavy duty lathes, one of the former being shown in Fig. 2. The parallel portion is rough turned and then finished to a diameter of 9.155 inches with a high and low tolerance of 0.010 inch

The profile for the nose is also roughed off at this time, being accomplished by means of a radius bar of the desired length of 18.4 inches, the point where the contour leaves the straight part being 10 1/2 inches back from the nose end. The profiling device is so arranged that the cutting can be performed in either direction; when cutting from the nose, the radius bar disengages from the central controlling pin at the desired point or, when cutting in the opposite direction, the bar will engage the pin at the proper time, the continued traverse of the saddle causing the cross slide to be drawn in as the moving end of the link passes through the arc formed by its radius. This bar can be seen below the shell and at the back of the saddle. The shell is driven by an expanding arbor, operated by means of a tapered key located in the body of the arbor. The average output on the lathes is about fourteen shells in ten hours.

Following the turning of the body, the nose is drilled out with a 111-16-inch drill. Two C.M.C. six-foot radial drills are used in this operation. On the baseplate of the machine two vertical arbors are located at an equal distance from the centre of the swinging arm, as this method permits the work

being done on one shell while the one just completed is being removed and another placed in position in readiness for drilling. As the drilling is performed through the centre used for rough turning, no guiding bushings are required,

bottom of which is kept central by means of the bush G. It will readily be seen that the device is practically automatic in its action, and the greater the pressure placed upon the drill, the greater will be the holding power of the

FIG. 5. DRILL JIG FOR HOLDING SHELL WHEN DRILLING NOSE.

but a special centralizing device is employed in connection with the upright post to hold the shell firmly while the metal is being drilled. Fig. 5 shows a cut of this arrangement, the post proper being secured to the baseplate of the machine, and the operating parts of the device contained within the piece B. Passing through the centre is the spindle C, to the upper end of which the semi-spherical piece A is secured.

The lower end of this central spindle is wedge-shaped to force the three jaws D out against the inner wall of the shell, near the open end. Bolted to the lower end of the spindle is the flanged collar E, which provides a support for the upper end of the releasing spring F, the

gripping jaws. The cut, Fig. 4, shows the operation of drilling of the shell nose. A number of trucks are used in moving the shells from one location to another.

#### Inside Boring

The next operation, that of boring and forming the inside nose contour, is effected on several Niles-Bement-Pond heavy projectile lathes; a group of these being shown in Fig. 6. The shells are held in a special chuck secured to the faceplate of the lathe, and the roughing out is accomplished with a three-blade, inserted, notched tooth cutter, the operation being performed at a cutting speed of 70 feet per minute, and a feed of 7-32 inch. per revolution. A copious

supply of cutting lubricant is always available, as the liquid from all the drip pans beneath the heavy machines is carried back to a central well, from which it is again forced to the various tools; by this method, sufficient volume of the lubricant is always at hand to wash out the cuttings from the interior of the shell. For the finishing cut on the inside bore, a two-bladed floating cutter is used; the heads in which these cutters are inserted being secured in the end of the heavy boring bar. A feature of these cutters is their readjustment after once becoming worn below the original size. Thin liners are inserted between the two cutters and are held in position with pins that pass through the liners and into the blind holes in the back of each blade. When the boring is completed, the open end is faced off by means of a box cutter held in the boring bar, the length being determined from the inside profile.

The special chucking fixture used on the heavy boring lathes is shown in Fig. 7. The main casting, that containing the operating mechanism, is firmly secured to the face plate of the lathe, a boss on the back of the chuck fitting into a recess in the plate to retain the fixture in a central position. Three equidistant jaws E, are provided, these having two shell gripping surfaces four inches long and three inches wide. To prevent displacement of the jaws, distance pieces F are keyed and otherwise secured to the conic sections of the outer casting. The lateral movement of the jaws is controlled by the position of the spider D, the legs of which fit into cor-

FIG. 6. BATTERY OF FIVE LARGE NILES-BEMENT-POND (BERTRAM) PROJECTILE BORING LATHES.

responding slots on the inner end of each of the three jaws. When the shell is in the fixture, the jaws are drawn back by driving in the tapered key B, acting on the gib C and the back of the slot in the spider D. A circular spring

ing to a diameter of 1.909 inches, facing and chamfering, and tapping with a two-inch fourteen-thread tap, right-handed. For this operation a Murehey collapsible tap is used, and is shown in operation in Fig. 9. An alternative me-

FIG. 7. HEAVY THREE-JAW CHUCK FOR SHELL BORING.

is provided to free the jaws from the surface of the shell.

A highly interesting feature in connection with the accurate and efficient maintenance of the inside boring and profiling cutters is the method adopted in this plant for grinding same. A cut of the device is shown in Fig. 8. The operation is very simple, yet highly satisfactory. The large cast iron bracket A, is securely bolted to the frame of the machine and carries the movable portion of the device. The slide B operates at right angles to the axis of the grinding shaft, and is adjusted for radius distance by means of the hand wheel G. The quadrant C revolves in a horizontal direction through an angle of about 30 degrees upon the central pin located in the slide B. The movement of the quadrant is obtained by the handle I, which passes through a swivel nut secured to the quadrant; the inner end of the screw being pivoted to the main casting A. The housing block D, which carries the work spindle, has a movement tangential to the central radius of the quadrant C. This piece D is operated along the slide by the hand wheel H, and is used when roughing off the cutter and also for finishing the parallel portion back of the profile. F is one of the cutter heads; F is shown in position, while E is a small groove pulley for revolving the work spindle, if desired. When any set of cutters becomes dull, thin liners are inserted at the back of each blade and ground back to the exact shape and size in this special grinding attachment, thus increasing the life and effectiveness of the cutters.

#### Finishing the Nose

With the exception of the size of the shell and the method of holding, the operations on the nose are identical with those of the smaller shells; that is, bor-

ing to a diameter of 1.909 inches, facing and chamfering, and tapping with a two-inch fourteen-thread tap, right-handed. For this operation a Murehey collapsible tap is used, and is shown in operation in Fig. 9. An alternative method may be adopted, that of the separate bushing, and when it is found that the hole in the nose is too large, this practice is generally followed. In the latter case, the rough nose of the screwed-in bush requires to be turned off. This operation is performed while the shell is held in a special chuck, similar to those used on the boring lathes, and the nose cleaned off with a box cutter held in the saddle fixture or tail stock spindle. Fig. 11 shows a cut of the Barret heavy projectile lathe used for this purpose. In the lower foreground is clearly seen the pipe carrying the used lubricant from the drip pans to the central well, from which it is pumped back to the various boring machines. Three Bullard special purpose machines are working on boring and tapping the nose, and the average output is about six per hour.

For turning the outside nose contour, twelve Earle lathes are used, eight on roughing and four on finishing. The method adopted is the same as that described when the profile was first roughed off by the use of the radius bar. These machines have a capacity of 25 roughed in ten hours, and 50 profiles finished in the like time; the latter process being completed in half the time that it takes to rough it.

#### Preparing Rifling Band Groove

After the shells have been weighed, the groove for the copper rifling band is put in. Three Niles-Bement-Pond lathes fitted with special waving attachments (developed in the shop) are employed on this operation; each having an output of five shells per hour. While the results obtained are practically the same as those on the smaller shells, the device used in making the waving ribs is deserving of special reference; a sketch of this highly interesting attachment is, therefore, shown in Fig. 10. The large gear B, which is firmly bolted to the faceplate of the lathe, meshes with the pinion C, the latter being keyed to the back shaft of the fixture; one end of this shaft D being carried in the bracket E secured to the bed of the lathe. To the rear of the saddle is secured the bracket G, by which the motion is transmitted at right angles through the bevel gears H and I; the gear H being fitted with a special bush, carrying the feather for driving purposes.

On the forward end of the front of the saddle is the bracket K supporting one end of the clutch operating shaft, to the outer end of which is secured the control lever S. The upper end of the bracket T is provided with two notches that govern the release and working positions of the clutch lever. A similar bracket (minus the upright portion) supports the back end of the shaft to which is secured the fork L, which operates the clutch M. The nut N is for taking the end thrust of the clutch. To the piece O secured firmly to the saddle

FIG. 8. RADIUS GRINDING ATTACHMENT FOR INSIDE PROFILE CUTTER.

is attached the sliding tool block R, the side movement of which is controlled by the action of the eccentric P, revolved by the shaft G, and bearing against the

roller Q, contact being maintained by means of the heavy spring T; the tension of the latter being governed by the adjustment of the set screw through the lug S. Roughing out the groove is accomplished by the tool W, undercutting

gether, fitted with one large table, making the whole into one unit. Owing to the weight of these shells and the difficulty in placing them in and taking them out of jigs, the light but serviceable device was constructed, as shown in Fig.

by the plate F. The piece B turned out to fit the nose of the shell and carrying the drill bush G, is secured to the opposite end of the frame, which is of  $1\frac{1}{2}$  by  $\frac{1}{2}$  inch bar iron. The feet of the jig are so arranged that the height to the centre line is equal to the radius of the shell. Following the drilling of the small hole, the nose is sized to exact dimensions by means of a Murchey tap held in the spindle of an upright drill press.

#### Preliminary Inspection and Internal Grinding

With the machining of the shell bodies practically finished, they are given a preliminary inspection, to check faults or errors in dimensions and workmanship. Before the adapters are fitted, the interior is carefully examined to see that no rough or uneven spots exist to cause subsequent trouble. It is a well-known fact that shells have been prematurely exploded after being discharged from the gun, often resulting in serious mishap where not intended. It is claimed that this effect results from the ignition of the high explosive by the heat generated through the friction between the inside surface of the shell and the contents therein. Immediately a projectile is discharged, two motions are set up; that of its forward passage through the gun chamber, and the motion about its own axis—caused by the copper band making its way through the rifling of the gun bore. The friction created by the forward thrust is not so great, as

FIG. 9. THREADING SHELL NOSE WITH "MURCHEY" COLLAPSIBLE TAP.

is performed by means of the tool V, and the waving is completed with the tool U. The first two tooling operations are done with the clutch in the release position, it being placed in gear when waving is in progress. The gear ratio is 9 to 1, this being the number of oscillations of the waving attachment during one revolution of the shell.

#### Finishing Base and Nose Threads

The base is now prepared for the adapters. While held in a chuck, the interior of the shell is re-bored to a diameter of 7 inches for a depth of 0.62-inch, leaving a square shoulder for the bearing of the adapter. For threading the base, two Holden-Morgan and two Lees-Bradner thread millers are used, the shells being placed in the machine from the rear and secured in position by means of a removable clamp fastened to the back end of the hollow spindle. The threads are milled in to a depth of 2.28 inches from the shoulder, and are 8 per inch, left hand. The object of the left hand thread is to eliminate the possibility of the displacement of the adapter during the flight of the shell, after it has been discharged from the gun. As the rifling of the gun bore has a right hand direction, the action of the shell revolving about its central axis will therefore have the tendency to keep the adapter firmly secured in position.

For the drilling of the grub screw hole through the nose of the shell, three small sensitive drills have been arranged to-

12, it being easily placed in position with the minimum amount of labor on the part of the drill press operator. When the shell has been placed on the drill

FIG. 10. GROOVING AND WAVING ATTACHMENT.

table, the light jig is dropped over it and the nose pushed into position by means of the screw E, passing through the end of the frame which is reinforced

the charge practically fills the entire shell; but owing to the sudden twist of the latter the momentum of the outer portion—or shell body—is considerably

FIG. 11. SOCKET AND NOSE FINISHING ON "BARRETT" HEAVY PROJECTILE LATHE.

greater than that of the charge within. This is reasonably presumed to be the chief cause of many prematurely exploded shells. On this account, if for none other, it is essential that the interior of the shell should be as free from ridges and ragged tool marks as it is possible to make it.

#### Internal Grinding Device

To accomplish this, a device designed by the foreman of the shop has been proven highly efficient, and has solved a problem that formerly caused considerable worry. The effectiveness of the arrangement is no more remarkable than its simplicity. An old lathe serves as a groundwork, the spindle being fitted with a head upon which two arms are securely bolted, care being taken that the overall distance of the bolt heads is not greater than the bore of

the shell, if these are permitted to enter the bore. To the outer end of these arms, which are of a suitable length and made of  $1\frac{3}{4}$  by  $\frac{3}{8}$  inch bar iron, are attached small blocks of broken grinding wheels, dressed off to fit the arc of the shell interior, and embedded in position with lead. In the operation of this device care must be exercised in starting up the machine, as it is absolutely necessary to have the grinding blocks inside the shell before the spindle is revolved. This is very obvious when it is understood that the spindle revolves at a speed of about 2,300 turns per minute, and with the arms about 12 inches long, the centrifugal force would cause the blocks and arms to take a sudden and undesired flight to some other portion of the shop. However, by the introduction of a couple of links, this danger has been practically eliminated.

#### Fit and Apply Adapters

Before further operations are possible

FIG. 12. DRILL JIG FOR GRUB SCREW HOLE.

FIG. 13. MACHINING ADAPTERS ON C.M.C. LATHE.

on the shell proper, the adapters are required to be fitted, and therefore a brief description of the machining of these parts may be here given. A section on the upper gallery of the shop is reserved for this purpose—a portion of the floor extending out over the main shop and under the crane runway, thus providing excellent facilities for the receiving of the rough forgings and the removal of the finished adapters to the assembly floor below. Two  $\frac{3}{4}$ -inch holes are drilled in the large end to a depth of nearly an inch, the centre distance being 3.85 inches. These holes, which are for the screwing in and out of the adapter are also utilized as a driving medium when turning to diameter and facing to length. The machining is done on several C.M.C. engine lathes fitted with four tool turrets on the saddle, each tool being reserved for a certain operation. The pilot or smaller diameter at the nose is turned

to a diameter of 6.485 inches with a limit of 0.005 inch either way; the thread diameter being turned to 6.675 inches (with the same tolerance), for a distance from the end of about  $2\frac{7}{8}$  inches. The shoulder is squared off and cut into a diameter equal to that of the pilot for thread clearance. The diameter of the large collar should be 7 inches with a low limit of 0.01 inch. This operation is shown in Fig. 13. After being turned, the adapters are placed in a chuck on a C.M.C. lathe and the back faced off to a thickness of  $3\frac{1}{2}$  inches. The threads are then milled on two Lees-Bradner machines, the threads being eight per inch and left hand; this operation is shown in Fig. 14.

Being now ready for assembling, the shells are firmly held (base upwards), in a special floor stand, the top of them being about 40 inches from the floor. The shoulder of the base plate or adapter, is marked with colored chalk and screwed in part way with a small single ended wrench; the last five or six turns by means of a double ended wrench having a radius of over 5 feet. As the adapter is reaching its final position, it often requires from six to eight men to operate the wrench, the driving pins of which are hardened and tempered. Before the adapter is removed, chalk marks are placed on the base as a guide for the following setting. The adapter is then taken out and the shoulder examined to see if it has been down on the seat, and, if passed by the inspector, it and the threads are given a coat of Pettman cement, the adapter being afterwards screwed to its former position. Two floor stands are used, and under good working conditions each one can fit and

FIG. 14. MILLING ADAPTER THREADS ON LEES-BRADNER MACHINES.

apply fifty adapters in ten hours. Following the application of the adapter, the shells are placed in the lathe to have the base faced off and the corner rounded, the radius of the latter being 0.2 inch. Three Niles lathes are used on this operation, each having a capacity of seven per hour.

#### Press-on and Turn Copper Band

The shells are now ready to receive the copper band, the ribs having been nicked as in the smaller sizes for the free escape of the air between the ridges as the band is being forced into position. Before being placed in the press, the

copper bands are heated in an oil-fired furnace to a dull red, or about 1,200 degrees F., being placed immediately thereafter over the base of the shell, in line with the groove, and hammered in several places to prevent slipping when dropped in the press. Several applications of the pressure (2,000 lbs. per square inch), are given, the shell being turned slightly between each. For the turning of the copper bands, three Warden-King band turners are employed, one of these being reserved as a spare, two being able to cope with the present output of the shop.

A view of this operation is shown in

FIG. 15. TURNING COPPER BANDS ON "WARDEN-KING" MACHINES.

Fig. 15, two of the machines being seen, with the air operating cylinder of the third in the extreme background. These machines are driven by a 10-inch double belt. The handle at the back in a vertical position operates the straddle bracket pivoted on the rear point of the saddle. This bracket carrying the two side cutting tools for facing the edges of the copper bands. The wheel at the left operates the cross slide, cutting the forward portion of the band with a broad nosed tool. The handle at the right operates the back slide by means of a worm and worm wheel connecting with a rack and pinion; the tool in this slide finishing the contour of the copper band to the desired shape and size. The small wheel directly above the right hand large one is for operating the undercutting tool, while the fixture secured to the cap of the front bearing is for gauging the location of the shell when being placed in the chuck, the valve for the operation of which is shown to the left and above the cross feed wheel. The runway shown at the lower left is typical of those installed in various sections of the shop, a number of these being provided with narrow cast iron rollers. Three men are engaged on these machines, one taking the finished work from the chuck while the other two place the next one in position and operate the various wheels and levers. The capacity of each of these machines is approximately twenty shells per hour.

#### Final Operations and Inspection

Following the turning of the copper bands, the shells are gauged and stamped, after which they are washed in a hot soda bath and rinsed in clear cold water, the heat of the shells being sufficient to dry the interior before it is varnished. However, before the varnishing process, the inside is thoroughly wiped out with a cotton rag to remove any dirt or moisture that may still exist. The shells are then passed on to be varnished, which is accomplished by means of spraying, the supply of varnish being contained in a small tank about 10 feet from the floor. Final inspection, stamping, greasing, and packing in readiness for shipping, follow in course.

#### NO BLACKLIST MADE OF CANADIAN FIRMS

A REVISED list of firms in the United States and elsewhere which have been blacklisted by the British Government, has been received by the Canadian Government. It is substantially the same as the former list which comprised some eighty American firms, but with some changes and additions. Representations have been made to the Government from various sources that the British blacklist should also be enforced as regards Canadian trade. It is not generally understood that although copies of the list

are on file in the Canadian Trade and Commerce Department, it does not apply in any sense to Canada, and that Canadian firms are free to trade unrestrictedly with whomsoever they will.

As far as can be learned, there is no intention on the part of the Government

IT appears that with the addition of zinc to aluminum the tensile strength gradually rises to 15.5 tons per square inch at 30.0 per cent. zinc. There is then a steady fall to 11.0 tons, with 96 per cent. zinc, and with further additions the decrease in strength is very rapid.

FIG. 16. TYPICAL 9.2 IN. MACHINED HIGH EXPLOSIVE SHELL

to make any change in this arrangement with which Canadian merchants are well satisfied. No Canadian blacklist has yet been established and such action will not be taken without careful consideration.

The ductility of aluminum is lowered by zinc, falling to 5.0 per cent., when 10 per cent. of zinc is present. All alloys containing more than 10 per cent. of zinc give approximately the same ductility, namely, about 2.5 per cent.

## MACHINISTS INSTRUCTION COURSE—X.

by J. Davies.

WHILE the completely equipped modern engine lathe is capable of performing a large variety of work, it is, like any other machine, limited by the variety and nature of

FIG. 38.

what might be termed accessory or small tool equipment. The making of many subsidiary devices is the duty of the tool room and includes such items as mandrils, arbors, centers, chucks, drivers, etc.

### Lathe Methods and Devices

On some classes of work such as turning bearings on a square shaft, or where it is not advisable to spot the shaft for a steady rest a device called a steady rest sleeve or a cat head is used. This is a loose sleeve that slips over the shaft and is fastened and adjusted by means of set screws so that the outer surface runs true, see Fig. 38. After it has been set true, the jaws of the steady rest are set to it as already described.

A modified form of cat head or spider

FIG. 39.

as it is sometimes called is shown in Fig. 39, consisting of a short piece cut from a round bar and fitted with set screws as shown. It is used for carry-

ing cored or bored work and is set by screwing the heads of the screws against the work until true. One advantage of this device is that if the cored hole should not be true the work can be set to remedy this, so that there will be an equal amount of metal all around the hole when finished, that is if there is sufficient stock on the outside to turn off. In cast iron work with a tapered cored hole or a small cored hole

FIG. 40.

piece of wrought iron is driven in, marked off and centred.

### Pipe Centers

In turning the outside of wrought iron pipes or similar work, a pipe center is probably the most convenient. Many types of pipe centers are in existence but in principle they nearly all consist of a steel piece similar in form to an ordinary center, but of slightly larger diameter than the pipe. In the back end, true with the point, a hole is formed, so that the center may be supported by, and revolve on a flanged stem fitted to the tailstock spindle in the ordinary way. See Fig. 40

### The Use of Mandrils

Mandrils are a very necessary part of the equipment of every lathe and probably the most abused. On account of not having sufficient number it is a common practice, to keep turning them down from one size to another to suit

the different jobs as they come along and often one mandril is used to drive another one out with. It is a generally admitted fact that a complete set of mandrils properly made, hardened and ground is a profitable investment, yet

FIG. 41.

not ten per cent. of our machine shops possess anything like a complete set.

Mandrils are commonly used on bored work up to 3 or 4 in. dia. The best mandrils are solid, made from tool steel, hardened and ground. They are turned a little small at each end and a flat machined on one side for the lathe dog. The center holes should be very carefully made so as to fit the lathe centers, and not be injured in driving in and out of the work. Fig. 41 shows a properly designed end for lathe mandril; the edge of the center hole is well rounded, and recessed slightly below the surface, so that the center hole is not damaged in any way while forcing the mandril.

One end of the mandril should be a push fit in the standard gauge ring of its size, tapering upward at a rate of .001 in. per inch of length for ordinary machine shop work. For specially fine work and tool room use, a taper of .0005 in. per inch is sufficient. Despite the fact that mandrils should be kept perfectly true, the careful lathe hand will always test them before using. It

FIG. 42.

is little trouble and saves much spoiled work.

### Use Care in Driving

Mandrils may become untrue from

wear of the centers, or they may be sprung driving them into the work. Before driving them in to the work coat them with oil and do not forget that you have to get them out again. If the work is a good fit very little driving is necessary; a hand hammer and a block of hard wood is sufficient for small work. Judgment must be used, however, and the mandril driven in tight enough to carry the work, taking care to preserve the center. In using mandril on work such as a large pulley with a small hole, do not put the dog on the mandril if it can be avoided, but drive direct from the work by a pin fastened on to the face plate. Stamp the size of the mandril on the large end to identify it. Always clean out the center holes of the mandril before putting it into the lathe and be careful not to cut up the mandril when facing bosses, etc., with the tool.

There are many types of expanding mandrils on the market, useful in many respects, and cheaper than solid mandrils where there is work of many different sizes, but for accurate work or repetition work the solid mandril is the best.

#### Adjustable Cone Mandril

Another form of mandril is the cone mandril, it consists of two cones made to slide on a parallel shaft. The cones are prevented from turning round by a

key, and the work is held between them when they are tightened up by a nut Fig. 42. Work that is intended for a mandril of this kind should be slightly chamfered at each end when boring to make it run true. This mandril will accommodate a large number of sizes, but is not to be recommended where very accurate work is required.

A very useful little mandril is one especially made for facing nuts. It is usually made very short and the thread which is a little shorter than the thickness of the nuts, is undercut next to the shoulder to make sure that the nut goes right up to the shoulder Fig. 43.

The best nut mandrils are those that have some kind of equalizing washer,

FIG. 43.

so that the nut centers itself true with the threads and not with the face of the nut, as would be the case if the nut were not tapped square, and was then faced on a mandril with a solid collar—the high spot on the face of the nut, pressing hard against the collar on the mandril, rocks the nut on the thread, consequently the nut is not faced true with the threads, this being overcome by the use of some form of equalizing washer.

#### Special Mandrils

There are many other forms of mandrils made for special jobs, one of which is probably the best method of handling the work it was designed for, i.e. turning locomotive and similar eccentric sheaves. The mandril is turned a close fit for the eccentric sheave, which is keyed on to the mandril, centres of the sheaves being made in the ends of the mandril.

To facilitate marking off the centres in the proper place, when turning

the mandril have the ends flat and smooth and make a very fine circle with a sharp pointed tool on each end equal in diameter to the throw of eccentric. Then with a tool on one side of the mandril and a surface gauge on the other, divide the circumference of the mandril into two exactly equal parts. The most accurate way to do this is to make a fine line on each side of the mandril, one with the tool and the other with the surface gauge, then pull the lathe half way round until the line made with the surface gauge comes exactly opposite the tool, and the line made with the tool comes exactly opposite the surface gauge, adjusting the height of the surface gauge until these two lines exactly change places, when the circumference will be divided into two equal parts.

FIG. 44.

Now mark two lines at each end of the shaft, one on each side, and the place the mandril on vee-blocks on the surface plate or marking off table, having the four lines in the same plane, or all the same height, then with the surface gauge draw an horizontal line through the centers. Draw another line parallel to this center line, being a distance away from it equal to lap and lead of valve. The two points A and B, Fig. 44, where this second line cuts the circle, are the locations of the centers in each end of the mandril.

#### IMPERIAL MEASURE CANADA'S STANDARD

THAT certain standards of weights and measures used in the United States, and which are frequently used in Canada, are not legal, is the statement contained in a Bulletin issued by the Trade and Commerce Department containing a synopsis of Canadian laws respecting the sale of food and other commodities. The purpose of the pamphlet is to help reduce the cost of living, in one way, that of familiarizing Canadians with the legal weights which they may demand in the articles they buy.

With further reference to the matter of United States standards in use here, the Bulletin states that these are as a rule about 20 per cent. smaller than the legal standards in Canada, that is, the Imperial pint, quart and gallon. The Bulletin gives the regulations applying to a long list of food and forage commodities, fuel, etc. It also gives the general standards of measurement such as that the standard pound, avoirdupois, must consist of 7,000 grains, and the standard gallon shall be of such a size as to contain 10 pounds of distilled water under certain prescribed conditions, etc.

A PATENT has recently been taken out by an English inventor, for a new petrol substitute, the constituents of which are cheap and entirely obtainable in that country. The fuel consists essentially of a solution of ethane and its higher gaseous homologues or isologues in paraffin oil or other liquid hydro-carbon under pressure. Coal gas produced by the low temperature distillation of coal is washed with paraffin oil or other liquid hydro-carbon under pressure and at a low temperature, and the solution of hydro-carbon gases so obtained is delivered under pressure into drums. For use, the solution of gases is drawn off from the bottom of the drum, and is delivered into the carburetter through a small orifice, without wire-drawing, so as to obtain the full atomising effect of the dissolved gases. The paraffin oil is partly or entirely volatilised in the carburetter, according to the proportion of dissolved gases.

# CONTEMPORARY WAR ARTICLES

Embracing Information and Data Drawn from a Variety of Sources Relative to and Arising from the Prosecution of this Many-Sided European War

## THE MANUFACTURE OF TUNGSTEN

**W**HEN the present war broke out the manufacturers of high-speed tool steel found themselves in much the same unfortunate position as the users of dye-stuffs, says *The Engineer*, cut off from their supply of tungsten, which forms an important ingredient in high-speed steel alloys. Like the dye-stuff industry, the manufacture of tungsten up to that time had been almost exclusively in the hands of the Germans, a firm at Frankfort having a virtual monopoly in this valuable commodity.

How this unsatisfactory state of affairs came about, and how long it would have continued but for the war, need not be discussed at this time, but it is almost certain that any attempt at manufacturing tungsten in Great Britain would have been met with such overwhelming competition from the German producers by price cutting that it would have had little chance of ultimate success unless a high tariff had been put upon the enemy product. The war has, however, taught us many lessons, which it is to be hoped the nation will not readily forget, and not the least is the necessity of preventing a foreign nation from obtaining a monopoly in any vital branch of industry. Such an industry is that of the production of the ingredients for such an essential as high-speed steel, the tungsten contents of which in the best qualities vary between 18 per cent. and 20 per cent.

### Tungsten Features

Tungsten is not found in nature in the metallic form, but as an oxide known as Wolfram, in which it occurs in combination with oxides of iron, manganese and calcium. For alloying with other metals the oxygen must be removed, either from the tungsten oxide after separation from the other oxides in the ore, or by removing the combined oxides and producing directly an alloy of tungsten and iron known as ferro-tungsten. This alloy has been produced in France, and to a small extent in Britain, but it is not sufficiently pure for the purpose of high-grade tool steel.

Following the outbreak of war, the Government instituted an inquiry by experts, including Lord Moulton, into the supply of this metal, and the means of securing it in adequate quantities, and signified its approval of a co-operative scheme by the leading high-speed steel makers for manufacturing tungsten in this country. A committee of these firms was formed, and with the assistance of

Julius L. F. Vogel—who had acquired experience in the manufacture of tungsten on a small scale—decided to erect a factory for the purpose in a district which afforded the best possible facilities for obtaining the necessary ingredient, hydrochloric acid.

### Manufacturing Concern Constituted

Thirty-one firms, the combined output of which in high-speed steel amounted to from 70 per cent. to 80 per cent. of the total manufactured before the war, took up shares in the concern. The company was given the title of High-Speed Steel Alloys, Ltd., and the following gentlemen were made directors: Messrs. Arthur Balfour, A. J. Hobson, Frederick Best, W. Clark, H. H. Smith-Carrington, C. K. Everitt, and W. F. Osborn. The erection of the works was commenced about the end of 1914, and by July, 1915, the production was begun. In September, 1915, the British Government took control of all Wolfram ore within the Empire and divided it amongst the makers of tungsten and ferro-tungsten. To assist in increasing the output of ore within the Empire the company purchased mines in Burma, which have been placed under the control of Dr. W. R. Jones, who was formerly in charge of the Indian Survey. Ore is also obtained from Australia, and it is hoped that before long South Africa will be another source of supply.

The works of the company are now in full swing. The factory occupies a site of about six acres, adjacent to two lines of railway. The raw materials consist of Wolfram ore, fuel, alkali, and hydrochloric acid, which are delivered on to a siding. The process of manufacture consists essentially in removing the tungsten oxide from the ore, recovering it in a highly pure state, and then in reducing this oxide to metal. Of eight departments employing some 160 hands, six are employed in the preparation of the tungsten oxide, and the remainder in producing the metal in the form of a very fine powder.

### Plant Data

The warehouse building for the storage of the ore, is equipped with an electric crane for unloading the ore direct from railway wagons; also a grinding and mixing plant by which the ore is crushed, ground, screened, and mixed with soda. There is also in this building a magnetic separator for dividing the tungsten ore from the tin ore, but a new building for grinding, roasting, and magnetic separation of the ore is almost ready for work. The next depart-

ment contains reverberatory coal-fired furnaces for roasting the mixed ore and soda, a process which occupies from two to three hours. The furnaces are arranged to economize floor space, and keep the fuel and furnace products on opposite sides, as well as to give easy flue connections to the common chimney. In the third department the furnace product is broken up and conveyed automatically into the next section. This department is served by an overhead crane, and the main shafting is run under the floor to give a free passage for the crane. The boiler-house adjoins this department.

Next, the furnace product is boiled with water, and the tungsten, which has been rendered soluble by the action of the soda, is removed from the other constituents of the ore by filtration. All the tungsten is thus collected as tungstate of soda, and passes to the succeeding department. Here the material is treated with acid, and the bright yellow oxide resulting is collected and taken to the next department, where the oxide is dried and prepared for reduction to a metallic state by mixing it with powdered anthracite coal. The mixture is then placed in crucibles, which are heated in coke stoves to reduce the tungsten.

The last named process will, however, shortly be improved upon, as a new continuous furnace, heated by gas from two Wilson bituminous gas producers, is now being erected. This will no doubt prove a great improvement and reduce the cost of manufacture. The reduced metal is afterwards washed in dish-shaped trays and dried, yielding the final product in the shape of a fine chocolate colored powder of 98 to 99 per cent. purity. This is packed in tin-lined wooden boxes containing about 200 lbs. ready for delivery.

For driving the machinery in the different departments, electric energy is used, but a steam boiler and engine are installed for driving some of the plant. Excellent, well-equipped and ventilated laboratories with a qualified staff of chemists under a chief metallurgist, are a very important feature of the works, for the making of daily assays of the raw materials and finished products.

The various promoting firms are to be congratulated upon the success which they have already achieved, in helping themselves by this co-operative arrangement whereby the producers are the users, and vice versa. The firms connected with this enterprise have helped in a very considerable degree to produce munitions for the Allied Powers in

quantities which would otherwise have been quite out of the question, and are thus doing a large share in winning the war. On this account the company deserves every possible encouragement from both the Government and the Empire. Arthur Balfour, the chairman, has worked indefatigably to bring about the success of the undertaking, and has been ably supported by A. J. Hobson, the vice-chairman, and the staff.

### THE HUMAN ELEMENT IN FACTORIES\*

By R. S. Rowntree.\*\*

WELFARE work may be defined as "the humanizing of industrial conditions." There are many employers who fully recognize that their responsibility to workers extends beyond the Factory Acts, but others still regard them impersonally as dividend-producing machines, readily replaced if prematurely worn out. Such ideas should not be encouraged. There never was a time in our national history when the elimination of waste was more important. To-day there is urgent need for every one of us to do his best and to co-operate for the common welfare.

Not only adequate wages, but reasonable hours of work, and care for the conditions in factories, and for the well-being of workers in their leisure hours, are in the interests of employer and employee alike. In the old days, when industry was conducted in small factories, the employer knew his workers personally, and took an interest in their welfare, but to-day, with enormous factories employing thousands of hands, this intimate contact cannot so well be maintained. Hence it has come about that "welfare departments" have been established in many factories, and hundreds of welfare supervisors have been appointed since the war began. The staff of such a department assists in engaging employees, and in selecting those suitable for the work in hand, investigates grievances and cases of dismissal, gives advice to employers regarding the provision of hygienic conditions, and of canteens, recreation rooms, suitable lodgings, etc. In some cases, the efforts of welfare supervisors have revolutionized conditions in factories, bringing about greatly improved relations between the workers and the management, and materially assisting output.

#### Of National Value

Such work is of national value. Workers will never be contented when they are asked constantly to work for longer hours than their physique can support, when they are unable to obtain sufficient and nourishing food, and when they have neither leisure nor opportunity for re-

creation. There are many factors which materially influence the operators; neglect to provide proper heating and ventilation or adequate and suitable illumination, inevitably has a prejudicial effect on the work done. The experience of the Ministry of Munitions has shown that the removal of such defects has had a beneficial influence on the quality and output of work, and some striking figures have been published in their recent bulletins on this subject.

Scientific methods of using labor to the fullest advantage, with a view to securing the maximum output, are not only necessary now, but of vital importance to our industrial future. The nation has never before experienced such a period of industrial pressure, and no one can foresee how serious might be the future consequences to the physique of the country of long-continued severe industrial fatigue. We must learn how to use human effort in the most scientific and humane manner, and the experience now being gained should be of the utmost value in time to come.

Needless to say, good results can only be obtained by steady, persistent effort, and by a steady campaign of education both of employers and employees. We must patiently strive to gain the confidence of the workers, and to explain how modern improvements and more scientific methods can do much to economize their labor and give quicker and better results. These and similar problems of common interest can only be solved by closer co-operation, frank discussion, and more cordial relations between master and man. No method of conducting industry is satisfactory which leads to a waste of human effort, and unless workers are happy and contented and well, they do not and cannot put forth their best efforts.

### CADMIUM IN SPELTER

AS to what is the maximum percentage of cadmium permissible in spelter, destined for the manufacture of cartridge brass, the best American authorities on brass-making say they do not know, states Professor Ingalls in an addition to his paper read at the last meeting of the Institute of Metals. Cartridge brass has been made successfully with spelter containing as much as 0.3 per cent. cadmium. Cartridge brass is ordinarily cast at a temperature considerably above the boiling point of zinc, which is far above the boiling point of cadmium, and it is generally impossible to find any cadmium in the brass, by the most careful analytical work, not even where the constituent spelter contains 0.3 to 0.4 per cent. cadmium.

There is no doubt that large amounts of cadmium, say, 1 or 2 per cent., make brass brittle, but it is hard to keep so much cadmium in brass anyhow. There is no reliable information at present re-

specting the effect of small amounts of cadmium in brass, and the evidence on this point is extremely conflicting. So far as the author knows, it has been definitely established that cadmium is injurious only in spelter to be used for sheet rolling, for galvanizing telephone and telegraph wires, and for making ornamental slush castings. The Zinc Committee of the American Society for Testing Materials commits itself no further.

### WAR DESTRUCTION OF SHIPPING

IT has been estimated by marine authorities that the destruction to shipping as a result of hostilities during the twenty-eight months of war ended December 1 amounted to 1,948 vessels, having a total gross tonnage of 3,627,082. The record includes all losses due to submarine warfare, mine explosions, gunfire and similar causes affecting the merchant shipping of the world, and is based upon all available sources of information concerning sinkings, including cable despatches and mail advices received from time to time.

Estimated at the current value of old tonnage, the total destruction represents a loss of more than \$400,000,000, but, as it would be impossible to replace the vessels under present conditions of shipbuilding at \$100 per ton deadweight on an average, the actual loss is much larger. This is without taking into consideration the value of cargoes destroyed with the ships.

November losses were the heaviest that have occurred in any one month during the current year, amounting to 120 vessels, with an aggregate gross tonnage of 285,357, or more than was destroyed in August and September together. Losses during the last eleven months have amounted to 1,749,079 tons, compared with 1,878,003 tons in the preceding seventeen months. During the last eight months the losses have been 1,372,598 tons, a figure which will probably be increased by later reports of November sinkings. The total is complete except for November, reports of losses being delayed sometimes until well into the succeeding month. The following table shows the number of vessels and the tonnage destroyed during each of the last eight months:

	Number.	Gross tons.
November .....	120	285,357
October .....	134	239,526
September .....	101	154,688
August .....	100	130,262
July .....	145	102,522
June .....	64	126,369
May .....	63	118,094
April .....	90	214,880
Totals .....	817	1,372,598

The average monthly rate of destruction since the beginning of the war has been something less than 130,000 tons, so that the November destruction is more than twice the average.

\*From a paper read at a meeting of the Circle of Scientific, Technical, and Trade Journalists, on November 14.

\*\*Director of Welfare Dept., Minister of Munitions.

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## VERTICAL SURFACE GRINDER

**T**HE vertical surface grinder shown in the illustration, although designed and used primarily for plain surfacing, can readily be adapted to circular grinding. The machine is the latest product of the Reed-Prentice Co., Worcester, Mass. The grinder is of rigid construction. The wheel head casting, of heavy goose-neck pattern, although separable from the column, may be considered integral with it, as the joint is a press fit and securely locked. The column is supported by the heavy base casting and is provided with a positive locking device. Vertical adjustment can be made upon its release, allowing work of varying thickness to be ground. The raising and lowering of the head is accomplished by either hand or power feed through a worm and rack.

The wheel spindle revolves in a nickel-babbitt bearing 3 ins. in diameter by 8 ins. long. The bearing box is tapered, allowing an easy means of take-up by the adjustment of lock nuts at top and bottom of sleeve. The upper end of the spindle is supported in a radial ball bearing of large proportions for absorbing the thrust while the wheel is cutting. Whatever back lash there might be is taken care of by a heavy coiled spring and two ball thrust collars. The drive to the spindle is through a 3-in. silent chain to a splined shaft mounted on bearings, making a "floating" drive to the wheel spindle, which is thus relieved of all side strain and vibration.

The wheel feed is controlled by a graduated hand wheel, which raises and lowers the spindle sleeve in its housing through a distance of 3 inches. This is more than ample for any grinding operation. Power feed can also be used, the feed ranging from .0002 ins. to .005 ins. The wheel chuck, which has a soft composition lining, concentrically closes over the wheel. A vertical adjustment of the wheel in the chuck is provided, so that the wheel may be used down to its last half inch without fear of crushing. With this method, a metallic band is no longer necessary in the construction of the wheel, a convenience which the user will appreciate.

The table bed is carefully braced and ribbed to insure permanent accuracy and alignment; the table has likewise been taken care of by the same means. The ways are provided with lubricating rolls, which are fed from reservoirs distributed the entire length of the bed. There are six table speeds ranging from 2 to 12½ feet per minute, the speeds being controlled by levers at the apron. Any feed may be instantly obtained even while the machine is operating.

Ample water or compound can be supplied at the same time to both the outside and inside of the wheel; the latter being reached through the hollow spindle.

By this means the surface of the work is kept clean at all times. Guards surrounding the table return the lubricant to the large tank at the rear of the machine, where it is again put into service by a centrifugal pump of large capacity.

The rectangular magnetic chuck is easily applied to the table. These chucks are completely waterproof, and are not subject to short circuits. The rotary chuck may be either magnetic or plain, and is dust and water-proof. The mechanism which does the driving is located outside of the water guards. Tilting the chuck permits concave surfaces to be ground, such as are frequently required on cutters, circular saws, etc. The power provision is, we understand, such that heavy cuts can be maintained without affecting the machine's capability of turning out work of the greatest precision. Data relative to leading dimensions, space occupied, weight, etc., follow:—

Table working surface, 12 ins. x 78 ins.; top of table to under side of grinding wheel, maximum (new wheel), 15 ins.; table traverse, 78 ins.; rectangular

VERTICAL SURFACE GRINDER—FRONT VIEW.

VERTICAL SURFACE GRINDER—REAR VIEW.

magnetic chuck working surface, 12 ins. x 60 ins.; height, 4 ins.; rotary chuck (plain), 16 ins. in diameter and 10 ins. high; wheel, 14 ins. in diameter, 4 ins. high,  $1\frac{1}{4}$  ins. rim; spindle speed, 1,050 r.p.m.; floor space, 5 ft. x 16 ft.; weight, 8,700 lbs.

### "TIP-IT" WELDING PROCESS

DURING the past two years many interesting developments have taken place in the metal working industry, for the more rapid and economic production of manufactured articles; more especially those pertaining to shells and their component parts. One of the chief factors in all machining operations is the maintenance of the cutting tools; and as high speed steel is indispensable for maximum production, the economic treatment of this metal has been one of the many problems that shell makers have had to contend with. The abnormal demands for this class of steel during the early period of the war and the shortage of supply, together with the small quantity of tungsten then available, resulted in a sharp advance in prices. Without alternative, shell makers were compelled, and also willing, to "pay the piper." However, with the lapse of time, various means were devised by which the high initial cost of tool steel was in large measure overcome. Many forms of welded points were brought into service with more or less success, the practice generally followed being that of electric welding.

Realizing that, in many respects, this process of welding injured the nature of the steel, one of the tool hardeners in a large Montreal shell shop continued experimenting to evolve a means of uniting the two steels by some other method, and finally succeeded in obtaining a suitable flux and means of application which has proved entirely satisfactory. This is now known as the "Tip-It Welding Process," and a plant for the manufacture of these tools has recently been established in Montreal. It was the original intention of the parties interested to furnish the flux to the trade, and

be reduced to the minimum, as the smallest pieces can be profitably used for tipping the various sized tools. The process of welding depends largely on the careful preparation of the pieces to be united, the high speed steel being slowly pre-heated and then quickly raised in a separate chamber to a welding temperature, the shanks being meantime heated in an open forge. The actual welding is done under a steady pressure of over two tons per sq. inch. When once welded, it is impossible to separate the parts, and it is claimed that the compound not only welds the metals, but actually penetrates the steel and improves the nature of same, cases being on record where welded tips have given

better service than the steel from which it was cut. The accompanying cuts show the style of weld and the proportion of high speed steel used to that of the entire tool, the bulk of the latter being of low carbon steel. J. R. Baxter & Co., Montreal, are selling agents for these tools.

### COMPACT FRICTION CLUTCH

THE friction clutch shown in the accompanying illustration is specially adapted for use as a part of any machine on account of its small size, and when modified to meet the requirements of in-

made a part of the shipper sleeve, forces the levers apart, expanding the ring and bringing its outer surface into frictional contact with the inner surface of the

SINGLE FRICTION CLUTCH WITH PULLEY.

friction cup, the hub of which is made to suit requirements.

The leverage is so compounded that very slight pressure is sufficient to operate the clutch. One screw which moves two taper blocks set into the levers adjusts the contact of the ring and cup to any required degree, the screw being easily reached with a screwdriver through a hole in the friction cup. The smooth shipper sleeve entirely covers the working parts, protecting them from dirt, etc.

These clutches are manufactured by the Carlyle Johnson Machine Co., Manchester, Conn., and have been extensively adopted on various types of automatic machines, besides being well suited for line and countershaft service. A double clutch is also made which occupies very little more space than the single type illustrated, and has two friction cups with hubs on which can be mounted pulleys, cones, gears, etc., of various widths and diameters.

### DRAWING DIE CALCULATOR

HERETOFORE very meagre information has been available regarding the design of double action drawing and combination. In attempting to draw sheet steel shells with one or more operations, it is most essential to select each operation so that the reduction can be made to the very limit without undue breakage. For example, the material commercially known as "deep drawn stock" will permit of a specific reduction, either when first converted into a shell, or when a shell is drawn into one of smaller diameter. If the reduction, however, is exceeded, the life will be taken out of the stock and the article will break during the operation.

Otto H. Jensen, Buffalo, N.Y., has departed from the old-time cut and try methods and has perfected a drawing die calculator, by the use of which anyone can readily determine the correct amount of reduction for given conditions. The instrument, as illustrated, is

EXAMPLE OF "TIP-IT" WELDED TOOL.

install the necessary equipment for the welding of the tools, but owing to the difficulty of firms acquiring the knack of successful application, the business is now exclusively handled by the makers of the compound. By this method the amount of scrap steel about a plant can

dividual machine tool builders is equally as satisfactory as the standard types. The Johnson clutch, as will be observed from illustration, consists of a body fastened to the shaft, carrying a split ring in which are inserted a pair of levers. A curve-shaped wedge, which is

in the form of a circular slide rule, founded upon actual results obtained through lengthy experiment.

The blank diameter is first calculated in the usual manner, after which the three revolving discs are easily set according to thickness of stock, etc., and

REVOLVING DISC DEVICE FOR CALCULATING DRAWING DIE DIMENSIONS.

the required data immediately indicated both for first operations and redraws.

### SURFACE GRINDERS FOR GAUGE AND DIE WORK

THE accompanying illustrations show two surface grinders, recent products of the American Machine Tool Co., New York, the smaller of the two, Fig. 1, being a hand machine while Fig. 2 shows an automatic machine. Referring to Fig. 1, this machine is of extra heavy construction, and has adjustable gibs on all sliding surfaces. Hand wheels on traverse feed and raising screw are each provided with indicator and graduated to one-thousandth of an inch.

The wheel spindle is of crucible steel, accurately ground and fitted to reamed and scraped bearings of generous proportions. These bearings are carried in solid bosses without caps, the front bearing being tapered to fit spindle and the rear one split on one side for adjustment. The spindle is carried in a slide which works on a rigid upright provided with scraped ways.

The platen is moved endwise by a crank fitted to the square end of a shaft operating a pinion, which in turn meshes with a rack on the bottom side of the platen, giving a quick travel without binding at any point as when a lever movement is used.

The countershaft, shown inverted in cut is provided with belt tightener, and the regular equipment includes a set of

wrenches and one emery wheel. The machine will grind 9 in. x 6 in. x 5 in., front spindle bearing 1 1/4 in. x 5 in., rear 7/8 in. x 2 3/4 in.; surface of platen 15 in. x 5 in.; spindle adjustment above platen 1 in. to 7 1/2 in.; floor space, 27 in. x 33 in.; weight, 500 lbs. uncrated.

The machine shown in Fig. 2 is a new type of automatic grinder for grinding and finishing dies, punches, gauges and similar work. The hardened and ground spindle runs in tapered split phosphor-bronze bearings and carries a wheel of 7 in. dia. x 1 1/2 in. face. The belt drive is on the double loop principle, which provides increased lap to the pulley. All slides and working surfaces are

provided with covers, protecting them from grit and foreign matter.

The feed mechanism box is bolted to the main frame, the feed gear having spur gears only, with bronze bearings for shafts. The table is 46 in. long and 8 in. wide with ample dust guards, and provides a working surface 18 in. x 6 in. The table travel is automatic, with adjustable dogs and automatic feed to traverse movement, which can be thrown out at any desired point by a stop; the traverse feed is from 0 in. to 3/8 in. at each reversal.

FIG. 2. AUTOMATIC SURFACE GRINDER.

Using a 7 in. wheel, this machine will grind work 18 in. long, 6 in. wide and 9 in. high. Floor space required is 65 in. x 30 in. and regular equipment includes one vise with hardened jaws, one 7 in. wheel, wrenches and countershaft, the latter having tight and loose

FIG. 1. SURFACE GRINDER FOR SMALL PARTS.

pulleys 8 in. dia. x 3 1/4 in. face, with drive pulley 16 in. x 2 1/4 in.; net weight with countershaft 1,490 lbs.

AMONGST the newer zinc alloys must be mentioned those of aluminum-zinc, which are being largely used for light castings in the automobile industry. For this purpose the alloys contain usually from 10 to 20 per cent. of zinc, with the addition of a small quantity of copper.

**Request for Enlightenment.**—We take the following from our contemporary *The Chief Steward*:—

Gents.:—The gas engine you sent me stops when theres nothing the matter with it thats the trouble. It wouldnt bee so bad if it stopped for some reason and anybody knows theres reasons enough for it to stop. I received the book which you sent me which is named "What Makes the Gasoline Engine Go." I can't read it because whats the use reading it when I don't care what makes the gasoline go as long as it goes which mine don't only occasionally, what I want to know is What Makes the Gasoline Engine Stop. If you got a book called that send me one. I want to know what makes my gasoline stop when everything is o k and nothing is the matter except that it must be a rotten engine.

### CANADIAN MUNITIONS PRODUCTION OUTLOOK

THE return of J. W. Flavelle, chairman of the Imperial Munitions Board from a two months' visit to the Old Country is expected to give an added stimulus to munitions production by our metal-working plants, with, at the same time, a quite generous assurance that, at least, while the war lasts, contracts will be readily available to all who show aptitude and expedition in filling them. Needless to say, the Chairman of the Board has made good use of his opportunity of conferring with those in direct contact with the munitions situation in Britain, and his giving expression to the circumstance of the fitness of our quality output, is matter for satisfaction to both our plant executives and our operators. It would seem, however, that we do not yet sufficiently realize the magnitude of this war undertaking, and therefore the responsibility laid upon us, to not only measure up to the time-schedule-quantity required, but to improve on the latter by every known art and artifice, and through the utilization of all available operative help, both male and female.

While perhaps some uncertainty exists as regards raw material purchases in the United States and elsewhere, there is ample evidence that, so far as finished shells are concerned, purchases outside the Empire will no longer be made. In the United States, existing contracts for shells are due to expire as a whole by the end of June, 1917, many of them as a matter of fact expiring at the end of March. While the war lasts, raw materials entering into the manufacture of shells will doubtless be in more or less demand from abroad, although in perhaps gradually decreasing quantity; nevertheless, heavy tonnages of steel, not to speak of metals, such as copper, etc., have been placed with United States steel mills for delivery right up to the end of 1917.

With the desire to accelerate production of shells in Canada, a corresponding demand is bound to ensue for both shell forging and shell machining equipment, and with the gradual elimination of the United States shell producer, less difficulty should be experienced in securing good delivery on either standard or special machines. Not the least important factor as far as the latter is concerned has been the congested condition of the railroad

transportation facilities, and while through a combination of circumstances, of which perhaps recruiting of the regular help for overseas service is not the least, to this phase of munitions production, the Munitions Board might profitably turn to attention with a view to modifying to a worth-while extent the prevailing disability.

### BRITAIN'S NEW WAR ADMINISTRATION

THE passing-up of Mr. Asquith, and his replacement as British Premier by Mr. Lloyd-George, have, it may be asserted, created world-wide interest, so much so that, during the past week, the daily air, land and sea routine of the actual combatants has been relegated to second place. Two and a half years of war has demonstrated beyond question that, in the administration and direction of each and all of its departmental features, there lies a man's job; in addition, the bringing of the gigantic conflict to its logical conclusion, gives clear indication that a succession of men, rather than otherwise, must needs lay hold of the reins. This latter, we take it, is responsible for a recreated British Administration, and while the means employed to establish the newly fledged regime have, according to report, a more or less sordid side, the time was actually ripe for a more vigorous and determined effort to win the war than in recent months has been in evidence.

This war before it can be brought to a successful termination for the Allies will involve a more or less lengthy series of relays—administrative in London and on the various battle fronts, just as much so as the necessity exists for such a plan being operative in the fighting line. While, therefore, great expectations have been aroused—largely due to Mr. Lloyd-George's personality and his already war record, there is just the possibility that many of them will remain unrealized when his stepping-out time comes, and the next man in line takes hold. Without being pessimistic, it may truthfully be said that it is still "A Long, Long Way to Tipperary," and if Britain's new Premier and his colleagues develop lines of supplementary activities as effective as those formulated by their predecessors in office, the fact that several reconstituted Ministries may yet be needed to realize final victory will in no way detract from any sectional achievement toward that end that our most recently created administration may establish.

### LACK OF SHIPBUILDING ENCOURAGEMENT

AN interesting sidelight is thrown on the shipbuilding situation in Great Britain, with reference of course to the increasing shortage of tonnage, through the opinion expressed by a well-known British ship broker in the course of a recent interview. He says:

"Every time a German submarine sinks a British ship, the owner gets the money for it, but he does not spend this on buying a new ship to replace the one lost. Why? Because the Government does not encourage shipbuilding in any shape or form, and the British shipowner has no facilities at present for procuring new ships. I could name half a dozen shipowners who, since the war, have sold all their boats and retired from business. These are old and experienced men—a great loss to the British shipping world. They were able to get very good prices for their ships, but were not tempted to continue in the shipping business in face of the many difficulties and the grave lack of Government support for post-war competition with the rest of the world. When these experienced shipowners drop out of British shipping it is a very serious thing for the Empire."

## INDUSTRIAL NOTABILITIES

**E**RVIN W. SAWYER, general manager and treasurer, Dominion Abrasive Wheel Co., Mimico, Ont., was born in Sterling, Mass., August 23, 1865, son of Edrick Sawyer and Augusta (Stuart) Sawyer. He was educated at public schools, Princeton, Mass., and began his business career as an apprentice to the Sterling Pottery Co., West Sterling, Mass., serving in that capacity from 1880 to 1883. Following this he joined the Sterling Emery Wheel Co., and remained with them until 1894, being plant foreman for some considerable time previous to severing his connection.

ERVIN W. SAWYER.

Developing still further his intimacy with abrasives production, he became in succession, foreman with the Springfield Emery Wheel Co., Bridgeport, Conn., 1894-1897; superintendent, Safety Emery Wheel Co., Springfield, Ohio, 1897-1910; and director and general manager, Dominion Abrasive Wheel Co., Mimico, Ont., 1910. In the latter connection, it may be stated, that to his progressive business efforts, the new plant there covering a site of three acres is largely due.

Mr. Sawyer married Katherine Melville, daughter of Thomas Melville, Charleston, N.H., in February, 1885, the family consisting of one son and one daughter. He is a member of the Canadian Manufacturers' Association, a member of the A.F. & A.M., and Congregationalist in religious creed. His residence is Parkview Mansions, Toronto.

Prices Per Lb. Unless Otherwise Stated.

active, the demand being quite heavy; sheet bars are now quoted at \$62 Pittsburgh, and the quotation on forging billets is now \$80. Iron bars have advanced ¼c per pound, the price being now \$3.25 per hundred. The local quotation on steel bars is now \$4, being an advance of \$2 per ton. Steel rails are active, with prices due for an advance. The situation in sheets would indicate a further advance over that noted this week.

The demand for sheets is very heavy, with the mills unable to cope with requirements. The advance on black sheets is about \$10 per ton, while that on blue annealed and galvanized is about \$5 per ton. The current Pittsburgh quotations are respectively \$5, \$4, and \$6.50 per hundred. The local changes on sheets this week are 50c per hundred, the quotation for No. 28 gauge being now \$5. It is almost impossible to obtain dull plates, and dealers here are asking \$5.75. Apollo brand 10¾ ounces. Galvanized has advanced to \$7.25, being 35c per hundred higher than last week. An advance on spikes and bolts, ranging from \$10 to \$15 per ton, has also taken place.

While wire and wire products have been steady of late, the outlook would indicate an early advance. A \$2 a ton advance has recently been placed on rivets, the quotation being now \$4.25 on structural and \$4.35 on boiler rivets. The exceptional demand for tubular goods, together with high labor cost, has resulted in advances in pipe and tubes; the local revision of boiler tube quotations showing an advance of from 8 to 20 per cent. Two-inch is now \$33; 2½-inch, \$35.75; 3-inch, \$48.50; 3¼-inch, \$54.50; 3½-inch, \$59.50; and 4-inch, \$65.50.

## Metals

The general tone of the metal market is well maintained and prices are holding firm. Copper is a little quiet, but the business is sufficient to keep this metal in a very strong position. Tin is a little unsteady, a weak tendency being apparent. Spelter is quiet following the recent activity, the situation showing an undertone of weakness. The feature of the week is the further strength of lead, which has shown a sharp advance. Antimony and aluminum are steady and unchanged.

**Copper.**—While the general tone of the market is quiet, the strength remains, prices being well maintained. The recent advance has apparently developed a shortage among the smaller producers and dealers, probably with the expectation that further advances were in order. With the tendency continuing towards firmness, there is a possibility that some copper may be uncovered for early delivery. There appears to be a movement on foot to merge several of the large producing interests for the object of securing better control of export

## The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents

**Montreal, Que., Dec. 11, 1916.**—Marked activity continues to feature the general industrial situation, with the steel market still in the front position. Favorable weather has been contributing materially to the transportation of supplies, as navigation is not yet definitely closed.

## Pig Iron

The pig iron situation is still featured by an upward trend of prices, this week's advance ranging from \$2 to \$5 per ton. The Pittsburgh quotation on Bessemer is now \$37.95 and basic \$32.95 per ton. Canadian quotations have practically been withdrawn, but dealers here are asking the nominal price of \$40 for Victoria.

## Steel

The upward movement, while not so pronounced as last week, still continues to feature the steel situation, and higher altitudes still are more than probable. One of the factors figuring largely in present conditions is the scarcity of raw materials. Again, owing to transportation difficulties, the mills are often seriously handicapped, delivery being very uncertain. The situation would be even more acute but for the unusually mild weather prevailing, and which has kept navigation open later than former years. Pig iron still continues to advance, thus affecting all lines of manufactured articles. Billets and sheet bars are very

matters. The market abroad continues steady. New York has advanced during the week, being 1c stronger. The present nominal quotations are 35c for lake, 35¾c for electrolytic, and 33½c for castings. Local conditions are unchanged, with prices very firm at 37c for lake and electrolytic, and 36c for castings.

**Tin.**—The market at present is reacting on a light demand, and prices are becoming easier. The supply however, is not great and a return to activity may result in a return of former quotations. London reports a further decline in strength, quotations having fallen off at the rate of about \$23 per ton. The New York market has declined about 1½ cents, the nominal quotation at present being 43¾ cents per pound. The situation here is weaker, although prices are being maintained but with an easier undertone, dealers are quoting 46 cents per pound.

**Spelter.**—The meantime market is quiet, but the general strength is well maintained. Producers are inclined to think that existing conditions do not warrant a decline, and are not taking an active part in current negotiations, believing that consumers requirements for the winter months will mean an early buying movement. The market abroad is firm, but New York has declined to 12½ cents, a drop on the week of 1½ cents per pound. The situation here is quiet, prices are maintained, however at 14 cents per pound.

**Lead.**—The scarcity of early metal and the continued demand has resulted in a very strong lead market. During the early part of the week the situation was a little unsettled owing to the fact that a wide range of price quotations existed between the leading and outside interests, but the action of the Trust in advancing prices has steadied the market. Business has been curtailed owing to shortage in supply. London market is firm. The recent advance on the New York market of ½ cent per pound has placed the quotations at 7½ cents for "Trust" and 8 cents for "independent" metal. Owing to general conditions, local dealers are asking higher prices, the week's advance of ½ cent making the quotation 10 cents per pound.

**Antimony.**—The market is very quiet on a poor demand. The local situation is dull, but dealers are still quoting 15 cents per pound.

**Aluminum.**—No change is noted; prices being firm at 70 cents per pound.

#### Machine Tools and Supplies

A fair amount of activity continues throughout the machine tool industry, some impetus being expected, following the action of the British Government

in confining the manufacture of shells more closely within her own and her Dominion boundaries. This will result in many shell plants increasing their capacity, as in all probability the output may require to be increased owing to the curtailment in other directions. The demand for tools of all description is very good, although deliveries are not too prompt. The abnormal condition that prevails in the steel and metal markets, together with the high labor cost is reflected in the high cost of machine tool equipment. The demand for supplies continues active.

#### Scrap

The market in old material is very firm and active. Quotations are generally strong with the exception of copper and brass, which have declined ¾ of a cent. Old light copper is now 22¼ cents, with other copper at 26¼ cents per pound. Brass clippings are quoted 17¼ cents, and turnings at 15¼ cents per pound. All other prices are as quoted last week.

#### CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion \$100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the Commission headquarters are at Ottawa.

Toronto, Ont., Dec. 12. — Recent events indicate that unlimited orders for munitions are assured for Canada and that these will be sufficient to keep the various plants operating at capacity for an indefinite period. It appears that this country is still behind on deliveries and therefore every effort must be made to bring the output of shells up to the required amount. The necessity of this is obvious but it can only be obtained by the fullest use of labor—male and female, and materials at our disposal. The munitions industry has developed into one of the greatest importance, not only in point of financial expenditure but as a material help to the cause of the Allies. Two new large munitions plants are being constructed, one in Ontario, and one near Montreal, while many plants already established are steadily increasing their output. The value of such an effort is incalculable.

#### Steel

As anticipated the coke situation has been relieved, and there is less fear of

a shut down at the furnaces in the meantime, although conditions are such that there may be a recurrence of the trouble particularly during extreme cold weather outlook in the steel trade is exceedingly favorable as regards volume of business but prices are reaching a dangerous level and show every indication of going considerably higher. The demand for steel continues very heavy, the mills being unable to take care of the required tonnage notwithstanding a steady increase in output. The Steel Company of Canada are building another open-hearth furnace, and it is understood that the Dominion Steel Corporation propose making important improvements to their plant at Sidney with a view to increasing the output as well as lowering the cost of production. The market is very strong and prices are still climbing. Wrought pipe has advanced about 5 per cent., affecting both lapweld and butt-weld classifications. Prices on steel bars are largely nominal and are subject to mill acceptance only. Bar iron is in better demand as it is being used as a substitute for steel bars in many cases, owing to the backward delivery on the latter material. A further advance in tubes is looked for owing to the very heavy demand in the primary market, makers being sold up for practically a year ahead. The situation in plates is getting tighter, the mills being sold far ahead with prices steadily advancing. Wire nails have advanced 35 cents and are now quoted at \$4.70 per keg base. Smooth steel wire No. 0-9 is 35c higher and is now quoted at \$5. per 100 lbs. base.

Scarcity of semi-finished material particularly sheet bars is becoming very serious. Many sheet mills in the U.S. are compelled to shut down for a day or two every week, on account of inability to obtain bars, and buyers of sheets are also embarrassed. Prices are advancing and 5c per pound seems to be the minimum for No. 28 black, while galvanized is selling freely at from 6.5c to 7c. Buyers of sheet bars state that the shortage of same is due largely to the use of very large tonnage of steel in manufacturing shells. Prices on black and galvanized sheets in the local market have advanced, but are nominal owing to the unsettled situation. No. 28 black are quoted at \$4.75, and a further advance is looked for in the near future, but No. 10 are unchanged in the meantime. Premier galvanized, No. 28, U.S. are now quoted at \$7.20 and Premier 10¾ oz. at \$7.50 per 100 lbs.

An interesting development of more or less recent date in the steel trade in the United States is the increase in the number of electric furnaces being in-

stalled to supplement the output from other sources. The scarcity of steel, especially that made by the crucible process is calling for a large supply manufactured by the electrical process. The mills are in a sold-up condition, some of the larger steel companies not quoting on any of their products, except on specified orders. The market continues very strong and higher prices on nearly everything in iron and steel are likely before the first of the New Year. Steel bars are unchanged at 3c, but iron bars are higher, being now quoted at 3.25c Pittsburg. Chicago warehouse prices have made a further advance and are now as follows:—Steel bars 3.60c; steel bars, 2 in. and up 4c; structural shapes 3.70c and plates 4.35c per pound. The unfilled orders of the U.S. Steel Corporation for the month ending Nov. 30 were 11,088,542 tons, an increase of 1,042,282 tons over the preceding month.

#### Pig Iron

Quotations on domestic pig irons are still withdrawn and no information is yet available as to when new prices will be issued. That they will be advanced is a certainty, but, how much, it is difficult to say. It is understood that a Canadian foundry interest in Ontario recently purchased 27,000 tons of basic pig-iron in Buffalo at \$30 per ton, furnace, which is now a minimum for that grade of iron.

#### Scrap

Prices of scrap continue to advance and the market is more active than for some time past. Prices of heavy melting steel, rolling mill scrap, old rails and axles are higher, same being in good demand. Foundry grades of scrap which in general have been relatively low as compared with pig iron are showing indications of an adjustment to higher levels. Scrap copper, brass and compositions, have made a further advance of 1c per lb. while lead and zinc are also higher. Steel turnings are in good supply and the market easy. The embargo on the export of this material to the States will again go into effect on Jan. 1.

#### Machine Tools

From all indications it would appear that an extended period of activity may be looked for in the machine tool market. The necessity of increased production of munitions means extensions to plants and consequently a continued demand for more equipment. Greater efficiency is demanded and to obtain this much worn out machinery will of necessity have to be scrapped and new equipment installed in its place. Business has been steady during the week, a number of enquiries having been received for standard engine lathes for

munitions and ordinary purposes. There is no sign of any decline in prices, in fact, indications point to further advances. An eastern U.S. builder of single and multiple drilling machines has advanced prices about 10 per cent., and a manufacturer of drill and surface grinders has made an increase of 7½ per cent. on his product.

#### Supplies

Higher prices continue to be the rule owing to the increase in cost of raw materials. Makers of pipe fittings have issued a new list of discounts which are as follows: Malleable A, list plus 5 p.c.; B and C, 12½ p.c. off list; cast iron, 40 p.c.; cast and malleable bushings, 50 p.c., and nipples 70 p.c. Chucks on the new list, are now list plus 30 per cent. as against list plus 15 per cent. formerly. The new discount on sprocket chains is 40 per cent., being an advance of 20 per cent. Coe's monkey wrenches are now net list, and list, and circular saws are now 35 per cent. off. A number of brands of files now carry a discount of 60 and 2½ per cent. as compared with 65 per cent. formerly. The increase in crude oil has caused an advance of ½c on coal oil, but gasoline is unchanged.

#### Metals

The outstanding feature in the metal markets continues to be the strong copper situation. Quotations on this metal have again advanced locally, although nominal. The tin market is easier due to a decline in London, but the position of this metal is fairly strong and a reaction may take place. Spelter is also easier, the demand having fallen off; quotations are unchanged. The strength which recently developed in the lead market has been well maintained, but there has been no further advance in prices. The antimony and aluminum markets are featureless with prices unchanged. Solders have declined.

**Copper.**—Although the primary market is quieter there is no sign of weakness, the dullness being due to the scarcity of nearby and first quarter metal. It is understood that none of the leading sellers have any copper for delivery before the third quarter of 1917, and metal is difficult to obtain from any source before that time. The market is very firm locally and prices have advanced 1c per pound, electrolytic being quoted at 38½c, lake 38c and castings 37½c per pound.

**Tin.**—A declining market in London has been reflected locally, and tin is down 1c, being quoted at 47c per pound.

**Spelter.**—Further weakness has developed in the market due to lack of interest on the part of buyers. Local

quotations are unchanged at 14½c per pound.

**Lead.**—An active demand for lead in the primary market has developed being induced by the steady price advances of independent producers, and the scarcity of metal for either December or January delivery. The leading interest has raised its price to 7½c New York for prompt metal, and 8c lead is likely before the end of this year. Local prices are very firm and unchanged in the meantime at 9½c per pound.

**Aluminum.**—The market is devoid of interest and quotations are unchanged at 68c per pound.

**Antimony.**—The market is dull and unchanged with hardly any business doing. Local price 18c per pound.

**Solders.**—The recent weakness in the tin market has resulted in lower prices on solders which have declined 2c per pound.

#### NICKEL COINAGE

A PROPOSAL whereby the Dominion can make \$5,000,000 to \$10,000,000 by substituting nickel for silver coins has been submitted to the federal authorities at Ottawa by Professor Leacock of McGill University. The professor, explaining his scheme, points out that silver is only a token to-day and can be replaced by nickel or tin or celluloid for that matter. He would call in the \$20,000,000 of silver coins in circulation and sell the metal in them as bullion. There is about 70 cents' worth of silver in a dollar's worth of coins. Nickel is worth fifty cents a pound, and the total coinage could be replaced for \$350,000. The cost of coinage would be offset by the saving now and in the future in buying nickel instead of silver. The professor proposes that the banks should act as agencies in exchanging the nickel for the silver coins. He undertakes to carry out the scheme himself without salary. He suggests that the original recoinage should bear the stamp:—"War money of Canada. 1917," and it would act as a monument of Canada's national thrift.

The National-Acme Mfg. Co., of Montreal, Cleveland and Windsor, Vt., has been taken over by an Eastern U. S. banking firm, and it is expected that the new company will be capitalized at \$25,000,000, but the name of the concern will not be changed. The company manufactures multiple-spindle and single-spindle screw machines, and also machine screws. At the Montreal plant an extension of 4,500 sq. ft. floor space was recently completed, and an additional 9,000 sq. ft. is now being made.

## Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department of Trade and Commerce, Ottawa, is able to present the following list of the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

<b>BRAZIL</b> Bahia, British Consul. Rio de Janeiro, British Consul General.	<b>ITALY</b> Genoa, British Consul General. Milan, British Consul.	<b>RUSSIA</b> Moscow, British Consul General. Petrograd, British Consul. Vladivostok, British Consul. Odessa, British Consul General.
<b>CHILE</b> Valparaiso, British Consul General.	<b>MEXICO</b> Mexico, British Consul General.	<b>SPAIN</b> Barcelona, British Consul General. Madrid, British Consul.
<b>COLOMBIA</b> Bagota, British Consul General.	<b>NETHERLANDS</b> Amsterdam, British Consul.	<b>SWEDEN</b> Stockholm, British Consul.
<b>ECUADOR</b> Quito, British Consul General. Guayaquil, British Consul.	<b>PANAMA</b> Colon, British Consul. Panama, British Vice-Consul.	<b>SWITZERLAND</b> Geneva, British Consul.
<b>EGYPT</b> Alexandria, British Consul General.	<b>PERU</b> Lima, British Vice-Consul.	<b>URUGUAY</b> Monte Video, British Vice-Consul.
<b>FRANCE</b> Havre, British Consul General. Marseilles, British Consul General.	<b>PORTUGAL</b> Lisbon, British Consul.	<b>VENEZUELA</b> Caracas, British Vice-Consul.
<b>INDIA</b> Calcutta, Director General of Commercial Intelligence.		

## Canadian Commercial Intelligence Service

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

# INDUSTRIAL <sup>AND</sup> CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## Engineering

**Hamilton, Ont.**—The Canadian Shovel & Tool Co. are building an extension to their plant.

**Norwood, Ont.**—W. C. Harrison's electric power plant was recently damaged by fire.

**Owen Sound, Ont.**—The Canadian Malleable Iron Co. are building an extension to their plant.

**Toronto, Ont.**—The Toronto Laundry Machine Co. are building an extension to their plant at a cost of \$7,000.

**Toronto, Ont.**—The Canada Steamship Lines have established a machine, wood-working and repair shop on the Yonge street wharf.

**Renfrew, Ont.**—Work has commenced on a machine shop for Mr. Low, of this town. The new plant is located near the Renfrew Electric Mfg. Co. factory.

**Toronto, Ont.**—A building permit has been issued for the construction of a boiler house on Mowat avenue, for the Russell Motor Car Co., to cost \$1,200.

**Sarnia, Ont.**—It is understood here that the Mueller Mfg. Co. propose making considerable extensions to their factory to take care of the increase in demand for their brass products.

**Campbellford, Ont.**—The Dickson Bridge Works Co.'s plant which is engaged in the manufacture of six inch shells was totally destroyed by fire last Sunday night. The loss is estimated at \$60,000, mostly covered by insurance.

**Belleville, Ont.**—The Mineral Products Co. has been organized to develop a fluorspar property, which has been discovered at Madoc, near here. Chas. R. Ross will be manager of the company, and Charles Campbell, of Boston, is financially interested.

**Oakville, Ont.**—The Aeme Rubber Co. propose establishing a factory here to make motor tires and belting. It is proposed to lease the Ware Building at first, and build a factory later. The town has been asked to guarantee bonds to the extent of \$50,000. J. H. L. Patterson, of Toronto, is president of the company.

**Welland, Ont.**—The Canadian Steel Foundries, Ltd., here, have let a con-

tract to Ryan & Gardner to build two open hearth furnaces and an extension 100 feet long to their machine shop. One new open-hearth furnace has lately been completed and with the above will double the capacity of the plant. The total extension will cost about half a million dollars.

**Montreal, Que.**—The International Manufacturing Co., which was recently incorporated at Ottawa with a capital of \$1,000,000, is a subsidiary of the International Fuse & Arms Co., of New York. A munitions plant will be erected in Montreal by Anglins, Ltd., of this city.

**Millerton, N.B.**—The New Brunswick Pulp & Paper Co. will shortly begin the construction of a new pulp mill which will have a capacity of 20 tons of wood pulp per day. The new mill will be erected on the site of the old mill which was destroyed by fire nearly two years ago. J. D. Volekman will be in charge of the new plant. Thos. L. Tomlines, of Watertown, N.Y., is the consulting engineer.

**Chatham, Ont.**—There is a probability that the Hayes Wheel Works will be converted into a munition factory. It is reported here that the Government has awarded a contract for the manufacture of fifty thousand shells to be completed before the first of June and that work will be commenced as soon as machinery can be installed. It is understood that considerable additions will be made to the present plant.

**Floating Drydock Projected.**—Arrangements have been completed for the construction of a large floating drydock at Vancouver. The structure will be a 16,000-ton, double-section dock, capable of handling a boat of 18,000 tons, which is the measure of maximum requirements on the Pacific to-day. The company is the Vancouver Drydocks, Ltd., with Charles Meek, of Vancouver, as the moving spirit. Bonds to the amount of two million dollars have been sold to Breed, Elliott & Harrison, of Cincinnati. A ship repair and shipbuilding plant is a part of the plan decided upon. Contracts for construction and machinery are being let, and the company announces that it will have the dock in operation within a year. There will be subsidy aid from the Governments of both the Dominion of Canada and the Province of British Columbia, on the ground that the dock will be a commercial and naval asset.

## Electrical

**Brigden, Ont.**—The Town Council are considering installing a Hydro-Electric system.

**St. Mary's, Ont.**—A Hydro power by-law will be submitted to the electorate on January 1.

**Stratford, Ont.**—By unanimous vote at a special meeting on Dec. 7, the City Council gave the third reading to the Hydro by-law, and it will be voted upon by the ratepayers on January 1.

**Galt, Ont.**—A by-law has been passed by the City Council authorizing the submission to the ratepayers at the January election of the question as to the Hydro-Electric municipalities going into the Chippewa Falls project.

**Oil Springs, Ont.**—The Council has passed the necessary by-law for the purpose of installing hydro-electric power, and a by-law to issue debentures to pay for same. The by-laws will be voted on by the ratepayers at the coming elections in January.

**Petrolia, Ont.**—The Town Council passed the by-law relating to the extension of hydro plants at Niagara and the electors will have a chance to vote at the coming municipal election on the question, which involves the principle of public ownership.

**Fergus, Ont.**—The Town Council has passed a by-law, to be voted on by the ratepayers on New Year's Day, to ascertain their opinion whether they are in favor of the Hydro-Electric Commission of Ontario acquiring the right to supply more power than it can generate under its existing contracts.

**Stratford, Ont.**—North Easthope Council at its last meeting decided to take no action regarding the request by the Hydro-Radial Railway Association and the Hydro-Electric Power Commission to submit a Hydro-Radial by-law at the January elections. This township is the only municipality, with the exception of Waterloo township, on the main line from Toronto to London, which has not passed the necessary by-law.

**Walkerville, Ont.**—The members of the Town Council decided to allow the ratepayers to vote on the by-law drawn up by the Ontario Hydro-Electric Commission to approve of a \$9,000,000 project to develop 200,000 additional horsepower at Chippewa Creek. The vote is on the distinct understanding that none

# Munitions! Munitions!

*Extract from an Evening Newspaper  
The Tragedy of Bucharest*

Munitions, Munitions, Munitions, are the words of an unanswered cry from Roumania and Russia. That cry explains the reason why Roumania and Russia failed to defend Bucharest.

**THE IMPORTANCE OF MUNITION MANUFACTURE CANNOT POSSIBLY BE BROUGHT MORE FORCIBLY TO THE ATTENTION OF CANADIAN MANUFACTURERS THAN BY "THE TRAGEDY OF BUCHAREST."**

**MANUFACTURERS WHO DEVOTE THEIR ATTENTION TO THIS BRANCH OF INDUSTRY ARE PERFORMING A VERY IMPORTANT PATRIOTIC DUTY, SECOND ONLY TO THAT PERFORMED BY THE MEN IN THE FRONT LINE.**

## **Our Service Department**

Recognizing the importance of this industry, we established a Service Department to collect all available data in connection with the various operations in the manufacture of Shrapnel and High Explosives, and are able to present in precise form complete information on the best methods of manufacture, and to provide the necessary skill and engineering help to any manufacturer who desires to enter this important work.

In the development of our Service Department it was found that the lack of proper buildings and manufacturing facilities has deterred many from going into this business, and in order to overcome this difficulty in some measure we have secured rights on several large properties with suitable factory buildings, and now have the following available for immediate possession:

### **AT COBOURG.**

The plant of the Provincial Steel Co., covering 15 acres, main factory 80 by 500 ft. Separate administration buildings. Railway Sidings from the main lines of the Canadian Northern Ry., Grand Trunk, and Canadian Pacific Railway.

### **AT ST. CATHARINES.**

The plant of the Russell Jennings Co., 150 ft. frontage by 515 ft., with suitable concrete buildings, 50 by 150 ft., with Grand Trunk Siding into the property.

## **Another Opportunity**

Besides the plant of the Union Switch & Signal Co., just purchased, we have secured another complete munition plant for the manufacture of ten thousand Shrapnel per day—another of the Pittsburg group.

**WRITE US ABOUT SUITABLE PLANT, FULLY EQUIPPED, AND LET OUR EXPERTS HELP YOU TO GET STARTED TO ANSWER THE IMPORTANT CALL.**

**The A. R. Williams Machinery Co., Limited**  
**TORONTO** - - **ONTARIO**

of the power will be exported. The people may also vote on the project to establish a Hydro-Electric system of radial railways.

## Municipal

**Blenheim, Ont.**—The Town Council are considering the purchase of a chemical fire engine.

**Vernon, B.C.**—Ratepayers voted favorably on a by-law to raise money for extensions to the electric light system.

**Tilbury, Ont.**—The Township Council of Tilbury North have passed a by-law to build a pumping plant at an estimated cost of \$6,320.

**St. Catharines, Ont.**—By a vote of five to three the Council decided not to submit to the ratepayers the question with regard to Hydro power supply.

**Newcastle, N.S.**—The Town Council are unable to get delivery of a motor-driven pump ordered some month ago, so may cancel the contract and call new tenders.

**Arcola, Sask.**—A by-law is being prepared for submission to the ratepayers authorizing a sale of debentures for the purpose of purchasing the electric light and power plant.

**Port Credit, Ont.**—The debenture by-law to enable the village to purchase the electric plant of the Port Credit Land Co. was confirmed at council meeting, December 4. Debentures are to be brought out immediately.

**Saskatoon, Sask.**—The City is in receipt of a letter from Laurie & Lamb of Montreal, urging the early selection of a site for the location of the incinerator which they have the contract to build.

**Montreal, Que.**—Bion J. Arnold, Chicago, has been engaged to report on the Tramways situation in this city, with reference to a renewal of the Montreal Tramways Co. franchise, and the City Council has voted \$10,000 to cover the cost of getting the expert's report.

**Waterloo, Ont.**—At a special meeting the City Council decided to submit two by-laws to the ratepayers at the municipal elections on New Year's Day, one providing for the purchase of the Snider dam and land surrounding, adjacent to the Waterloo Park, by granting the owners exemption from taxation on mill property in King street for a period of fifteen years, and the other on the question of the new Hydro power development scheme.

## General Industrial

**Renfrew, Ont.**—The Barnet Mfg. Co.'s plant will be re-opened early in the New Year.

**London, Ont.**—Hunt Bros. will build a flour mill and elevator here to cost about \$100,000.

**Bridgeburg, Ont.**—The Gilray Stretchor Co.'s factory was damaged by fire recently, the loss being estimated at \$600.

**Hamilton, Ont.**—John Ranston's grist mill at Cayuga, was destroyed by fire on Dec. 7. The loss is estimated at \$10,000.

**Arnprior, Ont.**—J. F. Munro, of Pembroke, Ont., is interested in a syndicate which proposes establishing a factory here.

**Hamilton, Ont.**—The Cummer-Dowsell Co., manufacturer of washing machines, etc., will erect an addition to its plant to cost \$16,000.

**Toronto, Ont.**—The Kilgour Davenport Co., will build an addition to their factory at 44 Osler Avenue to cost \$8,500. A building permit has been issued.

**Quebec, Que.**—A serious fire badly damaged the tannery of A. Falardeau, Caron and St. Helen streets, on Dec. 5. The fire was caused by an explosion among the varnishes and acids in the upper story. It is believed the damage will reach \$35,000.

**Peterborough, Ont.**—Fire on Monday night completely destroyed the Quaker Oats Co. mill here. The cause of the fire is attributed to spontaneous combustion in a drying-room adjoining the boiler house. The buildings and stock were valued at \$1,600,000, and the loss is said to be covered by insurance.

**North Bay, Ont.**—The toy factory by-law was carried on Monday by a majority of 159. The concession granted by the town was a free site and building amounting to \$15,000, and the usual exemption of taxes, excluding school taxes, for a period of five years. Work will commence immediately on the erection of the building as soon as the site is secured.

**Woodstock, Ont.**—The local tannery, which has been under the control of the Hamilton Oak Tanning Co., holders of a large mortgage on the property, has been disposed of to the Breithaupt Leather Co., Kitchener, Ont. The purchasers intend to materially increase the business, and already have made arrangements to ship in some \$200,000 worth of hides.

## Tenders

**Toronto, Ont.**—Tenders will be received, addressed to the chairman, Board of Control, City Hall, Toronto, up to January 16, 1917, for the installation of a 40 million Imperial gallon centrifugal sewage pump at the main sewage pumping station, Toronto. Specifications and forms of tender may be obtained at the Works Department, Room 6, City Hall.

**Winnipeg, Man.**—Tenders addressed to the undersigned will be received up to December 18, for the construction of 9½ miles of 5 ft. 6 in. reinforced construction pipe. Plans, specifications and form of tender can be secured on application to the district commissioners accompanied by certified cheque for \$20. R. D. Waugh, chairman of Winnipeg Water District Commissioners, 901 Boyd Building, Winnipeg.

**Ottawa, Ont.**—Tenders will be received up to January 15, 1917, for the construction of a reinforced concrete lighthouse tower and fog alarm building combined, and a wooden dwelling at Point Abino, township of Bertie, Welland County, in the Province of Ontario. Plans, specifications, form of contract and schedule of wages, can be seen, and forms of tender procured, at the Department of Marine, Ottawa; at the Harbor Master's Office, Toronto, and at the post offices, Welland, Port Colborne, St. Catharines, Bridgeburg, Hamilton and Brantford.

## Personal

**Lord Shaughnessy**, president of the C. P. R., has returned to Montreal from England.

**Prof. Frederick S. Kirkpatrick**, of Queen's University, Kingston, Ont., has been appointed a member of the Advisory Council on Scientific and Industrial Research.

**Wm. M. Ackworth**, a British railway expert, who is on the Commission to investigate Canadian railway matters in place of Sir George Paish, has arrived at Ottawa.

**Prof. A. B. Macallum**, University of Toronto, has been appointed Administrative Chairman of the Advisory Council for Industrial and Scientific Research with a salary of \$10,000.

**H. S. Southworth** has left Steel & Radiation Co., Toronto, to take up the position of sales manager for "Stellite" as manufactured by the Deloro Mining & Reduction Co., Toronto.

**A. P. Ridley** has assumed the position of manager of the Reliance Machine Co., Toronto, succeeding **Almon Hare**, who

Internal grinding. Another difficult job made easy by the use of the DUMORE. The above picture illustrates how the DUMORE Grinder simplifies difficult work. Think of the time of high-priced mechanics the DUMORE Grinder will save in your shop.

## The Stecher No. 4B

### Hand Screw Machine

Built with a view to obtaining the greatest rigidity and largest wearing surfaces. All useless adjustments, such as taper gibs in head-stock boxes and gibs under saddle, have been eliminated, as they are just so many extra parts to jar loose, and excuses for curious operators to throw the machine out of adjustment.

Other reasons for superiority are pointed out in our descriptive circular. Better send for a copy.

Friction Head, Automatic Chuck, Wire Feed and Hand Longitudinal Feed to Cut-off, Independent Stops to Turret.

U. S. A.

has been appointed chief engineer of the J. A. Brady Foundry Co., Chicago.

R. D. Keag, general manager of Yarrows, Ltd., Esquimalt branch, who recently died, was widely known and esteemed both in Canada and Scotland, having had a very extensive experience.

Joseph Wesley Flavelle, chairman of the Imperial Munitions Board, has arrived in Ottawa from England. Mr. Flavelle went to London to consult with the Minister of Munitions on matters affecting the production of shells in Canada.

Thomas G. Mathison, of Toronto, has been appointed chief engineer on the General Staff of the Dominion Public Works Department of Toronto. Mr. Mathison has been in the service of the department for five years. He is president of the Dominion Public Works Association of Toronto.

## Contracts Awarded

Toronto, Ont.—The Board of Control has awarded contracts for the following materials:—Brass work for house services, H. Mueller Mfg. Co., Sarnia; special castings, Reid & Brown Structural Steel & Iron Works; double stop-cock boxes, the Dominion Wheel & Foundries, Ltd.; 6-in. valve boxes, 4-in. valve boxes, iron castings of manholes, gullies, etc., John T. Hephurn Co., Standard Foundry Co., Reid & Brown, Don Foundry Co., Dominion Wheel & Foundries; pipe fittings and valves, James Robertson Co., James Morrison Brass Mfg. Co.

## Wood-Working

Granby, Que.—The Myer's Box Co. will build an addition to its factory, to cost approximately \$10,000.

Warton, Ont.—The lumber mill, owned by Johnson, Hunter & Crawford, has been destroyed by fire, the loss being estimated at \$10,000.

Flesherton, Ont.—Fire, which originated at the furnace, destroyed the drying kiln at W. Henry's planing mill, on Dec. 5. There was no insurance.

## Marine

Sarnia, Ont.—The Reid Wrecking Co. is preparing to raise the steamer Frontier, which lies at the bottom of the River Thames, at Chatham, where it sank a few months ago. The boat is owned by A. R. Bartlett, Windsor.

Toronto, Ont.—The Canada Steamship Lines propose keeping the "Macassa" in service between Toronto and Hamil-

ton, as long as possible, owing to the large amount of freight offering and shortage of cars. The steamer Dalhousie City will also continue in commission as long as possible.

Toronto, Ont.—The following steamers of the Canada Steamship Lines will winter in Toronto: Passenger—Cayuga, Chippewa, Corona, Chicora, Toronto, Kingston, Modjeska, Macassa, and Belleville. Freight—City of Hamilton, City of Ottawa, Joyland, Oatland, Haddington, Fairfax, Cadillac, besides ten barges and two tugs.

Winnipeg, Man.—It is understood here that a dock, capable of accommodating ocean-going vessels, has now been completed at Port Nelson, on Hudson Bay. It is 3,000 feet out from shore, and connected with the mainland by a steel trestle, over which trains will be running next summer to reach the ships. Grain elevators and warehouses will be located on the new dock.

Temiskaming, Ont.—The entire fleet of the Temiskaming Navigation Co., together with wharves, and all other equipment, has been purchased by R. Gibbons. The boats Meteor and Temiskaming will probably be taken into the Government shipyards on the Lake Shore Road for the winter to undergo repairs. It is the intention of the new owner to convert the Silverland into a tug, while the Jubilee will continue in the capacity of a tug.

Toronto, Ont.—The Canada Steamship Lines have arranged to place another steamer on the New York-Bermuda line, controlled by the company. The new steamer is the Trasosmontes, which will run in connection with the steamer Bermudian. The new vessel is a Portuguese craft, most modern in every detail. The company will also add to its fleet plying on the New York-West Indies-South American route. The freighters Canadian and McKinsty, which have just made their final trips on the Great Lakes with grain cargoes, are now on their way to New York to receive their initial cargoes.

North Vancouver, B.C.—Good progress is being made on the motorship Mabel Brown, at the Wallace Shipyards, and it is expected that she will leave the ways within the next fifteen or twenty days. The boat is being built for the Canadian West Coast Navigation Co., and when completed will be one of the finest craft of the kind on the coast. The Wallace Shipyards are hurrying the work on another vessel, the Geraldine Wolvin, a sister ship of the Mabel Brown, and it is expected that this boat will be ready for launching towards the latter part of January. About this time another vessel, which is being built at Victoria by the Cameron, Genoa Mills Shipbuilders, Ltd., will also be ready to take to the water.

## Trade Gossip

**Crude Oil Price Advanced.**—Pennsylvania crude oil was advanced 15 cents by the purchasing agencies on Dec. 7, making \$2.75 a barrel paid producers, the highest price ever reached in the history of the oil industry.

**Ottawa, Ont.**—The Michipicoten Power and Paper Co. has been incorporated, with head office in Toronto and capitalization of \$6,500,000, and will buy from Lewis Miller Wood, of Toronto, lands, pulpwood areas, and water-power rights.

**U. S. Steel Tonnage.**—Unfilled orders of the U. S. Steel Corporation for the month ending November 30 last were 11,088,542 tons, an increase of 1,043,282 tons over the preceding month. This establishes a new record for unfilled orders of the corporation.

**Locomotives for Russia.**—The Russian Government has distributed additional orders for 157 locomotives among the American, Baldwin and Canadian Locomotive Companies. Both the American and Baldwin Works will construct 66 locomotives each; the other 25 will be built in Canada.

**The Turbine Equipment Co., C.P.R.** Building, Toronto, has been awarded a contract by the town of Mimico, Ont., to supply and install three "De Laval" pumps at the sewage disposal plant. Two pumps will be direct connected to Canadian Westinghouse motors and the third unit to a 40-h.p. gasoline engine.

**Powder Co. for Canada.**—The plant of the Atlas Powder Co., at Mount Carbon, Pa., where high explosives were manufactured for the French Government for eighteen months following the opening of the war, is being dismantled. The machinery, vats and tanks are being removed to Canada, where they will be used for the same purpose.

**War Orders Enormous.**—Since the outbreak of war, Imperial purchases in Canada total an enormous sum. It is estimated that orders placed for the Imperial Government in Canada since August, 1914, amount to over a billion dollars. These orders were placed through the Government, Imperial Munitions Board and War Purchasing Commission and were for munitions, military equipment, foodstuffs and fodder.

**The Sault Shipping Co.,** a newly-incorporated concern, has purchased from the Lake Commerce, Ltd., of Toronto, the steel steamer Valcartier, formerly the W. H. Mack. The price was not announced. The boat will be delivered to the new owners at the close of navigation, and will be operated next season under the management of the Al-

gonia Steel Corporation at Sault Ste. Marie, Ont.

### Munition Experts Coming to Canada.

Forty young men selected by the British Government as munitions experts have arrived in New York on the steamship *Orduña*, from Liverpool. They will be assigned to the various factories in the United States and Canada where munitions for the Entente Governments are being manufactured under contract, and will pass on the output before it is delivered for shipment.

### Copper Trading Forbidden.

Except for the fulfillment of current contracts, the importation of copper into Great Britain, or dealings in copper without a special permit are prohibited by the British Government. The order also prohibits the use of copper for manufacturing purposes, except in the case of pending contracts, and direct inventories made of all stock of raw copper, the returns to be made not later than Dec. 16.

**American Shipbuilding.**—The Bureau of Navigation of the U.S. Department of Commerce reports that American shipbuilding had its greatest month in November, when one hundred vessels were completed, the gross tonnage of which was 82,552. All but two will sail under the Stars and Stripes. With respect to shipbuilding, the United States is busying itself, as is the case with the Maritime countries of the Old World. The war is taking a heavy toll of shipping, but this loss is stimulating the builders to greater efforts. There will be many ships on the seas to carry the world's commerce after peace comes.

**Collingwood, Ont.**—The agreement entered into by the directors for the sale of the Collingwood Shipbuilding Co.'s assets to Messrs. H. B. Smith, R. M. Wolvin and Capt. J. W. Norcross, was confirmed at a special meeting of the shareholders held here on Dec. 6. The capital of the company is \$1,300,000, for which the syndicate will give \$650,000 in fully paid-up shares, and \$1,950,000 of ten year bonds, bearing 6 per cent. The formal transfer will take effect on January 2 next. The deal includes the transfer of the yards and plant here, also the company's interest in the shipyard at Kingston, where the Government graving dock is under lease.

**Marine Insurance Higher.**—Advice from New York state that marine war risk insurance has made another substantial increase. Five per cent. is charged on all United Kingdom business whether passenger or tramp steamers. Last rates were 3 per cent., with fractional higher and lower quotations. Mediterranean risks cannot be placed under 7 per cent., while 10 per cent. is expected to be the general rate. London

rates are up to 5 per cent. on Transatlantic risks, an increase from 3 per cent. Mediterranean rates are firm at 7 per cent. for belligerent vessels, and 10 per cent. for neutrals. An explanation of the higher rates on neutrals is given in the low percentage of armed belligerent ships sunk.

### To Improve Plant of Dominion Steel.

Mark Workman, who returned recently from Pittsburg, stated that it was true that large sums of money would have to be spent from time to time on betterments by the Dominion Steel Corporation, but he added that this expenditure would be fully met by revenue and not taken from capital. Asked as to his mission to Pittsburg, the president of the Steel Corporation replied that he had improvements in mind at the Sydney plant, and that with such an end in view he and several officials had gone to the Iron City to get pointers. He explained that the changes at the Sydney works were intended to increase the annual output as well as to decrease the cost of steel. Word from Sydney was to the effect that everything is going well, that the coal situation is better, and that the outlook generally is exceedingly favorable.

**Hydro-Radial By-laws.**—All of the 25 municipalities except one, concerned in the construction of the proposed Port Credit, St. Catharines and Bridgeburg radial line, have taken the necessary steps to submit the by-law to its ratepayers at the municipal elections on New Year's Day. In West Flamboro Township, where the election of the new council by acclamation is expected, it is desired that the voting on the by-law be delayed until later in January. The municipal councils which have prepared to submit the by-law are: Townships of Toronto, Trafalgar, Nelson, East Flamboro, Boston, Saltfleet, North Grimsby, Clinton, South Grantham; the villages of Grimsby and Beamsville, towns of Oakville and Burlington, cities of Hamilton and St. Catharines, townships of Crowland, Humberstone and Bertec; villages of Port Colborne, Humberstone and Fort Erie; town of Welland and Bridgeburg.

**The Turbine Equipment Co., Toronto** have obtained a contract from the Town of Cornwall, Ont., to supply and instal two 10-in. De Laval single-stage pumps, each of which will have a capacity of 3½ million gallons a day against 180 ft. head when operating individually; 7 million gallons a day against 180 ft. head when operating in parallel, and 4½ million gallons a day against 310 ft. head when connected up in series. This installation is somewhat unique, inasmuch as the pumps will be driven by hydraulic turbines, which will be supplied by the Wm. Kennedy Co., of Owen Sound. The speed of these turbines will be 200 r.p.m.,

and to enable a speed of 1,650 r.p.m. being attained on the pumps a set of De Laval double helical reduction gears will be used between each turbine and pump. The contract price of the pumps was \$10,075, which includes a few valves and some piping. The price of the hydraulic turbines was \$5,000 each.

**High Price of Steel.**—Advices from New York state that the average steel prices have passed \$70 per long ton for the first time in the history of the steel trade. Steel beams rose from \$3 per hundred to \$3.25 and lifted the index price for the eight leading steel products to \$70.53. On top of this is the declaration from certain iron and steel experts that the top has not yet been reached, although the speed of the upward movement shows signs of being checked. The high prices have had no discernible effect on the buyers. Railroads a few months ago could have placed rail orders at lower prices, and could have obtained delivery by the middle of 1917. Now they have to pay much more and cannot obtain delivery until the spring of 1918. Meantime, many attractive foreign orders are available, but the mills are not bidding for them because they are already working at capacity and have a vast amount of unfilled orders.

The Toronto Iron Works report a heavy demand for oil fuel storage tanks. Among the orders received recently being the following: The Fess Oil Burners of Canada, five 8,000 gallon storage tanks for installation in the Robert Simpson Mail Order Building on Mutual Street; the Robert Simpson Apartment House on Blecker Street; The Flint Varnish Co., Perth Avenue; Clarke & Clarke, Christie Street; and in Earl Grey School, Toronto. The town of Chatham, N.B., one each standard 12,000 gallon and 5,000 gallon storage tanks; the Metal Drawing Co., St. Catharines, two 6,000 gallon tanks; the Canadian Bronze Co., Montreal, one 10,000 gallon tank; the Northwestern Brass Co., Winnipeg, one 10,000 gallon tank; the Goodyear Tire & Rubber Goods Co., Toronto, one 10,000 gallon tank; the National Mfg. Co., Brockville, one 7,000 gallon tank. The Dominion Steel Foundry Co., Hamilton, have duplicated an order for one 12,000 gallon vertical storage tank.

## New Incorporations

The Pinene Co. has been incorporated at Toronto, with a capital of \$150,000, to manufacture wood, coal, oil, and peat products of all kinds at Cobalt, Ont. Incorporators are: A. S. Holmes, Adam N. Davis and J. W. Mahon, all of Cobalt, Ont.

# STEEL CASTINGS

We are in a position to make immediate delivery of all kinds of steel castings, 100 lbs. and heavier.

*Send us your next order.*

**Dominion Steel Foundry Co., Ltd.**

Hamilton, Ont.

We are qualified Tool, Die, Jig, Gauge and Fixture Makers.

WRITE US.

Windsor Machine & Tool Works.  
WINDSOR, ONT.

**MORTON MANUFACTURING CO.**  
PORTABLE PLANERS  
DRAW CUT SHAPERS  
SPECIAL DRAW CUT R.R. SHAPERS

## "Barnes-made" SPRINGS

are the result of over sixty years' experience in spring making, combined with unsurpassed equipment and the workmanship of men who have been with us, ten, twenty and in some cases thirty years.

Write for booklet No. 7-T.

Established 1857.

**THE WALLACE BARNES COMPANY**  
218 South St., Bristol, Ct., U.S.A.

Makers of "Barnes-made" Products  
Springs, Screw Machine Products, Cold Rolled Steel and Wire

# METAL STAMPINGS

We are manufacturers of stamped parts for other manufacturers.

We do any kind of sheet metal stamping that you require. Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time.

We can finish steel stamping in Nickel, Brass or Copper.

Send us a sample order.

**W. H. BANFIELD & SONS**

372 Pape Avenue, Toronto, Can.

# Classified Advertising Section

Rates (payable in advance): Two cents per word first insertion; one cent per word subsequent insertions. Count five words when box number is required. Each figure counts as one word. Minimum order \$1.00.

Display rates on application.

## FOR SALE

**FOR SALE—TWO BAKER DRILLS NO. 310**, with pumps; almost new. 1 Colburn drill No. 14, with pumps; standard. Alton Foundry Co., Alton, Ont. (22)

**BROWN-BOGGS MARKING MACHINE FOR 45 shells**. Has been used for short time only, and is in good condition. Box 248, Canadian Machinery. (24)

**ONE REED TURRET LATHE, 8' BED, swing, 28"; 4 2" holes in turret**. This machine is in first-class condition and was only used on 3,000 shells. Is a very powerfully built machine and will bear fullest investigation. Box 241, Canadian Machinery.

**FOR SALE—45 H.P. GAS PRODUCER AND engine, complete**. Good condition. For particulars write Canadian Warren Axe & Tool Co., Ltd., St. Catharines, Ont.

**FOR SALE—STEEL WATER TOWER**, without tank, 94 feet high. Will support tank holding 13,000 gallons. Cost new \$1,600.00. Will sell for \$350.00 f.o.b. Shawinigan Falls, P.Q. Northern Aluminum Company, Limited.

**FOR SALE—ONE BROWN-BOGGS MARKING Machine**, suitable for 6" Mark XVI. or Mark III, English Shells. Only object in selling is that other methods of marking have been adopted. Price on application. Taylor-Forbes Co., Ltd., Guelph. (14)

**1 VERTICAL, SINGLE ACTION, DOUBLE cylinder hydraulic pump, 6" stroke**, all ready to connect up; almost new; price \$75. McGregor & McIntyre, 1139 Shaw Street, Toronto. (1f)

**FOR SALE—FIFTEEN HEAVY CAST IRON columns**, from thirteen to seventeen feet long. Columns tapered and have good heavy base and top. Also four roof trusses. Sixty feet long. Ten feet in centre, eight foot at ends. Will cut columns to suit purchaser. Woodside Bros., Port Arthur, Ont. (2)

**FOR SALE—IMMEDIATE SHIPMENT—New Heavy Duty Shell Boring Lathe** for manufacture of 6" High Explosive Shells. Write for complete specification. Wm. Hamilton Co., Ltd., Peterboro, Ont. (20)

**1—2-SPINDLE SHAPER, WOOD TOP, JOHN Ballantyne, Preston, make, used two months**. 1 Dynamo, 45 lights, Toronto and Hamilton Electric Co. make. Used five months. Good as new. Box 195, Jordan, Ont. (R.T.F.)

**FOR SALE—1 40 H.P. ROBB, ARMSTRONG** high-speed engine; 1 4 x 1 Marsh deep well steam pump, and 1 Barton generator, 80 lamp capacity, with switch-board. All in good order and cheap for quick sale. Richards-Wilcox Canadian Co., Ltd., London. (20)

**FOR SALE—TWELVE H.P. GAS OR GASOLINE Engine**. Gould, Shapley & Muir Ideal. In first-class condition. Cheap. Stedman Brothers, Ltd., Brantford, Ont. (21)

**DOUBLE-END FEATHERSTONE AXLE cutting off machine** with countershaft and equipment adapted for cutting off two 45 forgings at once. Bargain \$500. Medicine Hat Pump & Brass Mfg. Co., Ltd., Medicine Hat, Alberta. (1f)

**BAND SAW—COWAN & CO. MAKE, 30" Iron Frame**. Post Machine 29 1/2" x 33", Iron Tilting Table and Saw Guard, including Brazing Tools, setter for Filing, etc., has had very little use. Whaler, Royce & Co., Limited, 227 Yonge St., Toronto, Ont. (23)

**WE CAN GIVE EARLY DELIVERY ON** difficult fixture cutting, also on gauges and jigs. We have a large shop and the finest

equipment. Apply Box 235, Canadian Machinery.

**SHRAPNEL SOCKET AND ADAPTER** machinery, turret lathes, boring machines, cutting-off machines and thread millers tooled for operation. Globe Electric Machine Co., Hamilton. (1f)

## WANTED

**WANTED—BORING MILL, 30" TO 42" table**; state make, condition, time used, lowest price, and send cut to Winnipeg Machinery Exchange, Sutherland and Gladstone Sts., Winnipeg, Man. (21)

**WANTED—THREE TURRET LATHES** suitable for steel sockets, also Thread Millers suitable for milling outside thread of sockets. Give price and particulars to Steel Furnishing Co., New Glasgow, N.S. (19)

**WANTED—COMPLETE SET OF DRAWINGS** or blue prints of Universal grinder, with all attachments. Box 251, Canadian Machinery. (1)

**WANTED—POWER-DRIVEN ROLLER 8' long**, suitable to roll 3/4" steel plates; state make, condition, time used. Give price and particulars to L'Air Liquide Society, corner First Ave. and Ernest St., Maisonneuve, Montreal.

**WANTED—SMALL SCREW-CUTTING ENGINE lathe 12" or 13" x 5' or 6' bed**, automatic feed, power cross feed, compound rest; must be cheap and lathe in good working order; give full particulars in first letter. J. W. M., Suite 34, Thelmo Mansions, Burnett St., Winnipeg, Man. (24)

**WANTED—THE FOLLOWING EQUIPMENT** for 18-pr. H.E. shells:—2 electric or steam baking ovens, 2 painting machines, 1 banding press and pump, 2 band turning machines, 3 sensitive drills for drilling and tapping grub screw hole, 1 Bowser varnish pump, 1 marking machine. Send quotations to Box 253, Canadian Machinery. (24)

## FOR SALE WARNER & SWASEY TURRET LATHES FROM STOCK

Ten (10) 16 inch No. 2,  
Geared Friction Head  
Universal Turret Lathes,  
only used a few months—  
equal to new.

**Williams & Wilson**  
Limited  
320 St. James St., Montreal, P.O.

## SITUATIONS WANTED

**SUPERINTENDENT, DESIROUS OF** change, 18 pdr. shrapnel, and 6" H. E. shells. Box 247, Canadian Machinery. (26)

**EXPERT FOUNDRYMAN FAMILIAR** with all modern foundry appliances, desires position as foreman or assistant in gray or malleable iron foundry. Box 250, Canadian Machinery. (25)

**MECHANICAL ENGINEER, EXPERIENCED** in eighteen-pounders and six-inch nosed-in shells, with twelve years' drawing office, shop and general experience, will be disengaged shortly. Box 252, Canadian Machinery. (25)

**COMPTROLLER, OFFICE MANAGER,** chief accountant, credit man, executive ability. Twenty years' experience. Now holding responsible position. Desirous negotiating with large manufacturing industry offering good future prospects for equal services. Address Box 244, Canadian Machinery.

**SUPERINTENDENT WITH PROVEN MECHANICAL** and executive ability desires position as same, or one of equal grade. Wide experience with well known firms manufacturing high explosive shells, rifles, electrical machinery and instruments, light and heavy sheet metal and plate products. Have satisfactorily supervised installation and organized new plants for widely varied lines of product. Address P.O. Box 122, Dartmouth, Nova Scotia. (25)

## SITUATIONS VACANT

**TOOLMAKERS AND MECHANICS. APPLY** Pease Foundry Co., Brampton; Junction 4341. (3)

**FIRST CLASS GRIDLEY AUTOMATIC** men wanted to set up Gridley automatic machines, also operators for same, highest wages paid, only first class mechanics need apply. Apply 47 Richmond St. East, Toronto. (24)

**WANTED—NIGHT SUPERINTENDENT TO** take charge of factory making 4.5 sockets. Apply Box 237, Canadian Machinery.

**WANTED—EXPERIENCED STEEL** works draftsman for Nova Scotia. Give full particulars, including salary, permanency. Apply Box 234, Canadian Machinery. (17)

**ALL-ROUND MACHINISTS WANTED FOR** tool-room; highest wages paid. A. R. Ormsby Co., Limited, 48 Abell Street, Toronto. (21)

**WANTED—FIRST-CLASS MACHINIST** able to take charge of our repair shop. Apply Hull Iron & Steel Foundries, Ltd., Hull, Que. (23)

**MECHANICAL DRAUGHTSMAN WANTED** for tracing and detailing on general machine work, also opening for man with experience on plate and structural work. Box 245 Canadian Machinery. (23)

**SPLENDID OPPORTUNITY FOR YOUNG** man about twenty-one, well educated and with some mechanical knowledge, who desires to learn the machinery business. Apply in first instance with full particulars as to experience, etc., to Box 243 Canadian Machinery.

## REPAIRING

**ALL KINDS OF MACHINERY REPAIRED,** rebuilt and installed. W. H. Sumbing Machinery Co., 643 Yonge Street, Toronto, Ont.

# Applied Machine Design--Belt Driven Centrifugal Pump

By D. O. Barrett, M.E.

*A consideration of the engineering problems involved, together with a description of the manufacturing methods employed to produce a thoroughly serviceable machine in quantity, expeditiously, and at minimum over-all cost; a desirable combination achievement.*

THE cuts, Figs. 1 and 2 illustrate the subject matter of this article, a 1¼ ins. belt-driven centrifugal pump. As shown in the assembly view, an auxiliary geared pump is

These pumps were required in quite large quantities, and before taking up their manufacture, quotations were secured from all known builders. Many of the pumps submitted were of excel-

on the top were raised slightly in order to be finished by grinding, the piece being merely held against the disk by hand. A metal pattern was, of course, used. The four tapped holes in the

FIG. 1. CENTRIFUGAL PUMP ASSEMBLED.

driven from the end of the shaft by a pin clutch. This geared pump has both suction and delivery of ½ in. pipe, and is a stock article, not coming within the scope of this discussion. Its combination with the centrifugal was to enable the handling of two separate liquids, when and where desirable. The larger pump was designed primarily for the circulation of cooling water through the jackets of internal combustion engines. It was often desirable, to conform to underwriter specifications, to bury the main fuel tank some distance from the engine room, and pump the fuel up to the engine carburetor, the excess merely overflowing back to the large tank. In this way only a very small quantity of fuel was in the engine room at any one time. Should gravity feed be allowable

lent design and construction, and, in fact, their quality militated against their use, because for our particular purpose it was absolutely necessary to secure a pump of low cost yet capable of handling large quantities of water at a fairly low head. It was therefore decided to design and build a pump similar perhaps to many of those now on the market, but with a minimum of shop operations, thus reducing the first cost. To this end all lathe operations such as facing were eliminated, to be replaced by the cheaper yet equally serviceable method, disk grinding. All hand fitting was also to be done away with, or, where necessary, of such a character that skilled labor was unnecessary.

clamped down to conform to the outer surfaces.

## Pump Body

The body, Fig. 4, was, of course, the most intricate casting used. While there was nothing particularly difficult in its construction, it was the only piece in which it was necessary to use a dry sand core. Due to the fact that the outlet was offset slightly from the center of the main portion, it was necessary to part the pattern accordingly. This was done in order to keep the flange at the top of the outlet below the face of the casting, so as not to

FIG. 3.

pads were jig drilled, the flat jig plate being merely

FIG. 2. CENTRIFUGAL PUMP KNOCK-DOWN.

or were gas to be used as fuel, this pump was simply omitted, and being attached at any time if desired. In the view of the dismantled parts, the interior of the body is shown quite clearly, also the shape of the impeller.

## Pump Base

Taking up the design of the various parts, we will consider first, the base, Fig. 3. This was constructed as light as possible and ribbed to present a neat and finished appearance. The four pads

interfere with the disk grinding operation. A hardwood pattern was used for this piece, with a taper print the size of the face opening attached. The core was made in one piece necessitating, of course, a split core box along

FIG. 4.

the same lines as the pattern. After ramming the core in the box, one half was removed and the core bedded in green sand, after which it was turned over and the other half of the box removed. A print was also provided for the outlet. It will be noticed that there was a ring cored around just below the pipe thread; this was for clearance when tapping. A fine grade of core sand was used and the core coated in order to secure a smooth surface at the back against which the impeller runs. Ordinarily, this face is finished in the lathe, but, by exercising a little care in the foundry, no trouble was experienced in getting a smooth finish, and one sufficiently plain for minimum clearance for the impeller.

As only 1-16 ins. clearance was allowed between the ends of the impeller arms and the inside of the body, it was necessary that these be fairly central with each other. It will be noticed that the interior outlines of the case start from the outlet opening with the 1-16 ins. clearance and gradually increase in sectional area and clearance around again to the outlet, and opening into same with a gradual curve. For the guidance of the pattern-maker, sections were given through the four points so that templates might be made accordingly. The inside contour of the case is a gradual increase in order that there may be no eddy currents formed as the water leaves the tips of the impeller arms and continues its journey around to the outlet. There must also be a minimum of clearance between the impeller and the case and cover, otherwise there will be an appreciable amount of slippage or "lost motion." Ordinarily, the water as it leaves the outlet opening and enters the discharge pipe should have a velocity of approximately 10 feet per second.

In disk grinding the face of the casting, it was merely held by hand, after

operations, the pieces were taken to the screw machine and chucked on the inside, using a three-jaw scroll chuck. The  $\frac{3}{4}$  ins. hole for the shaft was then drilled and reamed, and the end tapped

ent case, however, the work was done in a single-spindle press of the usual type.

### End Plate

Fig. 6 shows the end plate, the face of which was also disk ground. For drilling, the same jig as for the body is used with the exception that a hardened steel cone is dropped over the central bolt, this centering the piece with respect to the inner curved surface. After the holes around the outer edge are drilled, it is dropped over pins corresponding to these holes, these pins being located in a flat plate clamped to the drill press table and central with the spindle. It was not necessary to clamp the plate when tapping, the pressure being all downward. A four fluted drill was first run through, followed by the pipe tap. As the castings were rather light in both cases, the pipe taps were of the interrupted thread type, these requiring much less power to drive, due to the fewer cutting points. A metal pattern was, of course, used, with the name of the concern in raised letters around the edge.

### Impeller

The impeller, Fig. 7 was disk-ground on the one side and then clamped in a self-centering fixture to the face plate of the screw machine, where the central hole for the shaft was tapped. The shaft was provided with a shoulder, this making positive drive and being much quicker than keyseating and doing away with all hand fitting. The central raised points are for the purpose of cutting into the incoming stream of water and leading it down to the impeller arms. It will be noticed that there are four small holes leading into a groove entirely around the back. This was for the purpose of balancing

FIG. 6.

for the packing gland. The jig shown in Fig. 5 took care of all drilling with the exception of the  $\frac{1}{4}$  in. pipe tap for the grease cup, the location of this not being particular. The casting was centered by being dropped over the  $\frac{3}{4}$  in. central clamping bolt, and held by the nut and washer. A narrow planed surface at the bottom squared up the base. Into the tapped boss at the side of the jig was screwed a long cold drawn steel handle so that it was unnecessary to clamp the jig even when tapping the  $1\frac{1}{4}$  ins. hole for the outlet. Removable bushings were used for the tapped holes for the end plate. When drilling the drain hole in the bottom, the jig was set on an angle plate. For best results, these

FIG. 5.

which it was clamped to the table by a quick-acting clamp and the base ground square with the face, using the swinging table. After the grinding

should be handled in a three-spindle gang drill arranged for tapping, so that it would be unnecessary to change the speed of any of the spindles; in the pres-

FIG. 7.

the pressure which, quite naturally, would tend to force the impeller in against the body. To prevent same from rubbing against the end plate, the

collar at the outer end of the shaft is provided, enabling any end motion to be taken up. When assembling, the amount of this end play, or clearance, of the

used at each end of the shaft and no grooves were cut in the bearings.

#### Bracket

The bracket in Fig. 10 was also jig

FIG. 8.

impeller in the body, is determined before bolting on the end plate; should this be too great, the end plate is simply ground off the necessary amount.

#### Pulley and Collar

The pulley in Fig. 8 was cast in green sand from a split metal pattern, although the intention was to eventually cast these in a heavy split metal chill, dumping out the castings as soon as set and before chilling occurred. By thus dumping out quickly and covering up with sand so as to cool off slowly, no trouble was experienced in the machining due to hardness. The chill was to form the outside surface with dry sand cores dropped in for the inside and also to form an easy method of gating. To date, the chill method has not been used, but experience which the writer has had with other similar parts would indicate that it should be a complete success. Special soft jaws were used in the screw machine for holding while drilling and reaming for the shaft hole. No machine work was done on the outside, as these came fairly smooth, and it was only necessary to grind off a slight fin due to the parting in the mold. A 3-inch single ply belt was used to drive the pump. No particular features are encountered in either the collar or packing gland as both are plain screw machine jobs.

#### Outer Bearing

The outer bearing, Fig. 9, was drilled in a plain jig, and babbitted after assembling the other parts on the base. After pouring the babbitt directly on the regular shaft, the bearing was removed from the base and an expansion reamer run through the hole for shaft clearance. Compression grease cups were

FIG. 9.

drilled similar to the outer bearing. Due to the flexible drive used for the auxiliary pump, it was not necessary for this to be in perfect alignment with the shaft, as the drive worked equally well in either case. This consists merely of two 1/4 in. pins tapped into the collar on the end of the shaft, and a pin of the same size driven through the shaft of the gear pump.

A complete bill of material is given

FIG. 10.

covering all the parts used in the construction of the pump. No originality whatever is claimed in the design as the problem was purely a manufactur-

ing one. The capacity of the pump ranged from 25 to 40 gallons of water per minute under the average head encountered in internal combustion engine work, the speed varying from 1,000 to 1,500 revolutions per minute. While

the writer is not privileged to give out any figures on the cost of production of the above article, suffice it to say that it was much less than what any other similar pump could be purchased for, and that the expense for patterns and the few simple jigs was amply taken care of on the first lot.

A METHOD of protecting iron by enameling is described in the "Foundry Journal," as follows: The metal is first pickled in hydrochloric acid to free it from foundry scale, then washed thoroughly and dried. The first coating applied is composed of 34 parts silica, 2 parts soda, and 15 parts borax, mixed in water. The metal thus coated is exposed for 10 to 15 min. in a dull-red-hot retort. A second coating is then applied, consisting of 34 parts feldspar, 19 silica, 24 borax, 16 oxide of tin, 4 flour-spar, 9 soda and 3 saltpeter. This mixture is first melted in a crucible, then ground to a fine paste in a little water and applied with a brush. The coated piece is then again subjected to white heat in a muffle.

### CANADIAN GOVERNMENT RAILWAYS SNOW PLOWS

A CONTRACT for 20 steel snow plows is now being executed by the Canadian Car & Foundry Co. for the Canadian Government railways. With the exception of one or two minor alterations, these will be duplicates of those built recently for the Intercolonial Railway. The leading truck is of 30 ton capacity, being specially designed with inside bearings only, on the axles, the clearance on the outside of the truck not being sufficient to allow for outside boxes.

SNOW PLOW FOR CANADIAN GOVERNMENT RAILWAYS BUILT BY CANADIAN CAR & FOUNDRY CO., MONTREAL.

Tender type of journal boxes are used, equipped with Davis cast steel wheels 28 in. dia. The rear truck is of the standard 30-ton freight car type, having 33-in. cast iron wheels and M.C.B. axles.

The alterations referred to include a modification of the side wings which are now built with curved instead of straight plates, resulting in a better clearance of the snow when in action. Compressed air is used for operating the side wings. Ice cutters are now fitted in front of the wheels of the leading truck for the purpose of removing ice from rails at intersections where it is necessary to lift apron of nose. These cutters are carried in guides attached to the forward end of the leading truck frame and are raised and lowered by compressed air. The large drawbar casting which projects from the nose of the plow has been extended more than in previous designs so that plows may be coupled together, nose to nose, with greater ease than heretofore.

The overall length of the plow is 32 ft. 1 in.; width over side sills, 8 ft. 9 in.; height, rail to top of cupola, 14 ft. 10 in.; approximate weight, 60,700 lbs.

### FINANCING CANADIAN WAR ORDERS

AT a meeting of leading bankers with the Minister of Finance at Ottawa on

Dec. 15 arrangements were made for financing British war purchases in Canada during the next year. They will probably aggregate two hundred and fifty million dollars. Canadian war expenditure will probably amount to the same sum, and as borrowing in the British market is now out of the question the financing will have to be done largely in Canada. Sir Thos. White is optimistic as to the situation, but national economy and national savings are necessary. With the co-operation of the banks a national savings campaign is

dress—the said overall to fasten at side or back and to include sleeves buttoned or otherwise secured at their ends.

3.—Any machinist found trying a gauge while her machine is running will be liable to instant dismissal.

4.—Belts must be changed by a male supervisor, or a man specially appointed for that purpose, and not by the ordinary operative.

5.—Machines must not be cleaned under any circumstances whatever while running.

6.—No guards shall be removed from any machine without authority from the supervisor, and such guards are to be replaced and the machine inspected and passed by the supervisor before a restart is made.

### FACTORY CONDITIONS IN TORONTO

DR. HASTINGS, in his monthly report to the Toronto Board of Health last week, stated that satisfactory progress was being made in connection with improved hygienic conditions in factories and industries throughout the city. When inspection of industries was first made, in several printing and publishing houses, engraving works, brass works, mills and factories, employees were found innocently subject to inhaling lead and other trade dusts, chemical fumes, fumes from melting pots, etc.

A re-inspection of all such places so far made, shows that devices have been installed, such as hoods, suction fans and blowers, to ensure better protection for the employees. Devices have also been installed in iron and conduit works to control gases formerly allowed to pass into the air to the detriment of nearby residents.

It is further reported that bubbling fountains and individual glasses are also taking the place of the insanitary common drinking cup. Ventilation has also been improved. Only one inspector has been engaged on this work and his report shows that, in 1916, approximately 1,400 factories may be classified as good, as compared with 1,293 in 1915; 552 as fair in 1916, as compared with 418 in 1915; 29 as poor in 1916, as compared with 183 in 1915. One of the chief complaints was lack of provision for expectation. These cases numbered 1,031 in 1915, but this year there were only 48.

### FEMALE LABOR IN MACHINE SHOPS

AS is well known, women and girls have been employed in the machine shops of Europe to a large extent since the outbreak of the war, on account of the need of the men at the front. The *Travelers' Standard* states that this change in industrial conditions has made it necessary to revise certain of the rules and regulations prevailing in such shops for the guidance of the employees. Following is a list of special rules that have been adopted by the Scottish Iron Trades Employers' Insurance Association, Ltd., for use in machine shops in which women are employed:

1.—No female worker shall be allowed to be in machine shops unless her hair is tightly done up, well secured, and confined by a tight-fitting cap of close net or of some other suitable and efficient material.

2.—Further, she must wear a close-fitting overall completely covering the

AFTER a large ladle has been lined with fire brick in the usual manner it should be daubed with a mixture of fire clay and sand or with loam. The daubing should be very thin, its object being merely to interpose a friable material between the brick lining of the ladle and the brass scull that usually forms, thus enabling the latter to be easily removed when cold.

## MOULDING A LEAD SAUCER FOR EXPLOSIVES MANUFACTURE

By J. H. Eastham.

**A**DENSITY of 708 pounds per cubic foot, and specific gravity of 11.35, regarding water as unity, together with its searching

FIG. 1. PLAN AND SECTIONAL VIEWS OF WORK.

qualities when poured at a reasonably high temperature, render lead the most uncertain of the non-ferrous metals; hence the use of loam or dry sand moulds in preference to green sand in most cases where castings of heavy section or considerable depth are

FIG. 2. FOUNDATION PLATE.

required, a case in point being the denigrating tower saucer shown in plan and section at Fig. 1, this piece, 36 in. dia.

x 24 in. deep, x 2 in. section, weighing approximately 3,700 lbs.

### Conditions of Production

A concern engaged in the manufacture of explosives, frequently requiring lead castings of this type, but of varying proportions, supplied blue print and pig metal to the foundry receiving the order, with a free hand as to methods of production, at a fixed price per piece on machined castings of good quality and appearance.

To insure good results these castings were for some time swept up in loam by established methods, at considerable cost for rigging, a foundation plate of diameter convenient to the specified area of casting ordered and approximately 3 in. thick, being first made, and set level, a 2 in. spindle inserted in the three-armed socket of usual type. The core foundation and sloping parting necessary to the formation of the lower extremity of the cheek portion of the mould were next swept up on a single course of bricks, the structure being then ready to receive the cheek lifting ring shown at Fig. 3.

FIG. 4. CHEEK MOULD AND STRICKLE.

The sweep was then bolted to the spindle arms, and the outside face of the mould built up, after which the flanged branch pattern was bedded in at the correct height above the main flange, and drawn outwards, the outside face of the branch flange being covered by a cake core. The mould at this stage is shown in cross section in Fig. 4.

### Sweeping the Core

The sweep board was next removed, and the cheek mould hoisted on the stove car. The core sweep was then bolted to the spindle and the core built on a light brick wall, with a circular perforated grating covering the inside cavity one brick depth

from the full height, as indicated in Fig. 5.

The spiked plate illustrated in Fig. 6,

FIG. 3. CHECK MOULD LIFTING RING.

technically termed the crown or cope plate, with pouring gate and riser perforations, was now swept up, the rounded edge on the seat of the casting being taken care of by a slight increase in the length of the prods on the plate. The three mould sections were afterwards all dried on one carload, blackwashed, assembled as shown in Fig. 7, and the piece cast the following day, 4,500 lbs. of pig lead being melted in a small emergency cupola, and poured from an ordinary sand-lined geared ladle.

### Cost Demands Change of Method

The method just described occupied a moulder and helper about 20 hours on ordinary sizes, exclusive of the time spent on plates and other equipment, and

would have served indefinitely, had not competition rendered a heavy curtailment in cost of production imperative, the system of moulding afterwards employed being as follows:—

A pit approximately

FIG. 5. CORE.

48 in. diameter by 34 in. deep, was opened up in the foundry floor, the 2 in. spindle-centre bedded a few

inches below the pit face and rammed hard to secure its rigidity, the spindle inserted, and the sweep A bolted to position as shown by Fig. 8. A runner core, B, was laid level so as

FIG. 6. COPE PLATE AND STRICKLE.

to feed the casting by the "bottom pour" system, the runner stick C being rammed up at the same time as the outside face of the mould. The flanged or

FIG. 7. LOAM MOULD ASSEMBLED.

open end of the saucer being cast upward in this instance,  $\frac{3}{8}$  in. extra thickness was allowed on the upper face to ensure clean machining as well as to overcome any unevenness on slight shrinkage which might occur on account of the piece being cast open sand.

A heavy, well bound facing sand was prepared, the mould being rubbed over with dry plumbago and afterwards washed with molasses before the application

FIG. 8. DRAG MOULD IN SAND.

of the charcoal fire used as a skin drying medium.

#### A Suspended Core

The loam core shown in Fig. 9, built on a cast grid instead of the foundation

used in the former method, was now lowered to position, lead spool chaplets 2 in. thick being used at six points on cast iron blocks bedded in as indicated in the cross section view of the finished mould at Fig. 10. The core was finally hooked up to rail sections laid across the mould, this precaution being necessary on account of the certainty of the lead chaplets being melted by the metal during the operation of pouring, with consequent danger of the core sinking. The rails referred to also acted as weight supports, all risk of the core moving being thereby eliminated.

#### Economies Effectuated

By this method the moulding time was reduced to ten hours, the time occupied in building the core being about four hours, a saving of six hours on each piece. The castings produced were free

FIG. 9. LOAM CORE FOR SAND MOULD

from "strikes" or "fins" and of as good quality as those formerly turned out of the expensive loam mould, with its initial cost in rigging.

**Cost of Living.**—The cost of living is still going up. According to a Labor Department Bulletin of December 16, the average cost of 29 staple articles in sixty cities in November was \$10.05, as

FIG. 10. ASSEMBLED SAND MOULD WITH LOAM CORE.

compared with \$9.30 in October, and \$8.02 in November, 1915. In the wholesale prices of 272 commodities, the index figure rose to 198.4 for November, compared with 187.2 for October and 158.7 for November, 1915.

## MELTING STEEL IN THE IRON FOUNDRY CUPOLA

by J. E. Hurst

**D**URING recent years, the addition of steel to iron foundry mixtures has become quite a common practice. In addition to finding an outlet for comparatively valueless steel scrap, such additions present an easy and effective means to the ironfounder of producing low silicon cast iron.

The process of melting steel in the iron foundry cupola is now fairly well understood. The steel in the cupola in contact with carbon—coke—and in an atmosphere containing carbon monoxide, absorbs increasing amounts of carbon as the temperature rises, exactly as is the case in the cementation and casehardening processes for the treatment of steel. As the carbon content of the steel increases, the melting point correspondingly decreases, and it will readily be seen that the melting point of the steel in the cupola is rapidly reduced by the absorption of carbon to a figure within

the temperature range of the cupola. Approximately, the average maximum temperature in the cupola is in the region of from 1,350 deg. to 1,400 deg. Cent., and, therefore, the very fact that the steel is successfully melted indicates that it must have absorbed between 3 to 4 per cent. of carbon. This being the case, it was considered impossible to melt steel alone in the cupola, and if successful, to produce an iron of, say, from 3 to 4 per cent. total carbon, with a low silicon, phosphorus, and, with due care, sulphur contents.

#### Experimental Data

The following account of an experiment in this connection will doubtless prove of interest. The steel scrap charged into the cupola consisted of borings and turnings, crop ends from 5-in. billets, and miscellaneous scrap, consisting largely of old files and the like. A small proportion of hematite pig iron was added, the object being to ensure melting. It has subsequently been found that this

addition was unnecessary. The cupola charges were 560 lbs. each, consisting of scrap in the following proportions: 560 lbs. of steel borings; 280 lbs. of crop ends; 112 lbs. of miscellaneous scrap; 19½ lbs. of hematite No. 3 pig. The

mean carbon content of the above charge would be approximately 0.45 per cent.

Limestone and coke were charged as in the usual practice, a slight excess of each being allowed. The blast was started and the charge soon showed signs of melting. The blast pressure as indicated by the gauge was very high—28 in. of water—a fact that was ascribed to the closeness of packing of the charge. The melting continued successfully though at a somewhat slower rate, as would be expected, than is the case in an ordinary pig iron charge. The metal tapped out was very "wild" and emitted showers of sparks; but was readily quietened by the addition of ferro-manganese or ferro-silicon. The molten metal was cast into pig bed and allowed to cool. On breaking the cold metal, which was exceptionally tough, it presented a close white fracture. During melting a thick, black, sluggish slag was formed, which from its appearance evidently contained a high percentage of iron. An analysis made of the pig produced gave the following results:—

	Per Cent.
C .....	3.98
Cr. ....	—
Si. ....	0.13
Mn. ....	0.45
S. ....	0.071
P. ....	0.034

Obviously it would be an easy matter to produce any desired silicon content by the addition of ferro-silicon to the molten metal and, with the possible exception of a rather high sulphur content, it will be readily seen by the above analysis that the pig iron produced could be classed alongside of hematite or even cold blast irons.

The total weight of metal charged into the cupola was 7,056 lbs., and the total weight of metal tapped out and recovered from the "dump" was 6,496 lbs., thus showing a fairly heavy loss of 560 lbs., or approximately 8 per cent. It is considered that this heavy loss was due largely to the oxidation of the very fine borings which

such a heavy loss as that experienced in this particular case, the whole experiment proved to be a paying proposition. If the market value of the original scrap is reckoned to be on an average \$14.68 per ton, the total cost of the pig iron produced by the melting of this scrap, including melting costs, labor and standing charges, and also the melting loss, works out at approximately \$23 per ton. The market value of the pig iron produced at the present time is at least \$31.60 per ton. Undoubtedly a paying proposition.

The two great drawbacks to the melting of steel in this manner are, first, as already pointed out, the excessive loss through oxidation, and secondly, the tendency of largely increasing the sulphur content. By avoiding the very small and fine class of borings, or resorting to some form of briquetting process, the first drawback can be materially reduced to a normal figure. In connection with the sulphur content, the greatest possible care must be taken in the selection of the fuel. The addition of extra limestone together with sand is a most efficacious method of keeping the sulphur content down, and in addition gives a more fluid and manageable slag.

The action of limestone and sand in the reduction of the sulphur content is possibly somewhat similar to that of the blast furnace, in which the sand and limestone react with the oxide of iron, forming a basic double silicate, which at temperatures between 1150 deg. and 1300 deg. Cent. is capable of dissolving sulphur from the iron according to the equation:

From *The Engineer*, and published by the author with permission of Richard Hornsby & Son.

FIG. 1.

FIG. 2.

### A PATTERNMAKING KINK.

By A. L. Loy.

WHILE watching the pattern work production on a large engine bed recently, the writer saw the following kink used

in getting out one of the rather odd-shaped pieces used in its construction. While there is little new or unusual in its application, yet one will often see journeymen patternmakers doing an almost endless amount of fitting when getting out similarly shaped pieces, and even then it is generally necessary to use a large quantity of putty, and a large fillet to cover up an ill-fitting job.

Fig. 1 shows the piece to be cut out. One end was cut at an angle, while the other was the circumference of a circle. There was, of course, nothing difficult in laying it out on a plane surface, but the trouble arose when trying to saw out these ends, due to the angularity of the sides giving only a line bearing on the saw table. The block was shaped according to the end view and slightly longer than necessary. The end pieces, AA, were nailed on, the nails being placed so as not to be hit later by the saw. The template T was then laid out to the desired shape and nailed to these end pieces with its one edge corresponding to the edge of the block. The block was next sawn out, the saw teeth just clearing the template T. When laid in place, the block fitted almost exactly, and the process described above required hardly any more time in its application than does its description, which may at least be of service to some one under similar circumstances.

### CONTRACT PLACED FOR COKE OVENS

CONTRACTS involving a sum said to be between \$2,500,000 and \$3,000,000 have been let to the H. Koppers Co., Pittsburgh, a by-product ovens concern, by the Dominion Iron & Steel Co., Sydney, N.S., for the construction of a large number of by-product coke ovens. They will be built on the most improved plans, that by-products from the coke production can be extracted to full advantage.

The Koppers Company is one of the largest concerns of

constituted the major portion of the borings used in the charge. With a heavier class of borings, or such material as plate punchings and cuttings, the extent of this loss can be easily reduced to 3 or 4 per cent. Even with

its kind in the world, and has received some very large contracts recently for the erection of by-products ovens. To handle the above order, a large force of men will be employed.

## GAS BURNERS FOR INDUSTRIAL WORK

WHEN it is considered that 0.5 per cent. of carbon monoxide in air is sufficient to kill a robust human being, and that 0.1 per cent. is dangerous and that this gas acts as a cumulative poison, the dangers to health caused by improper methods of combustion of gas and defective ventilation are obvious, says the *Engineer*. Many of the objectionable features of gas as a means of heating metal or other cold surfaces are overcome to a degree by mixing the gas with air under slight pressure previous to its arrival at the point of combustion. This gives a form of blow-pipe flame, and it is possible by this method to add to the gas the exact volume of air required for complete oxidation. The result of adding the requisite quantity of air to the gas is to make the mixture explosive, and, to prevent it exploding back into the mains, the mixture must be allowed to pass through and to burn upon a thick gauze or perforated plate. Back explosion is also preventable by increasing the speed at which the gas is flowing through the mains. A combination of the two, namely, a thin perforated plate and the gas flowing at a fairly high speed governs the method adopted in a series of experiments carried out recently by Mr. F. S. Sinnatt and described in the *Journal of the Municipal School of Technology, Manchester*. The flame obtained by burning gas in this way was carefully examined, with the following results:—

### Experiment Data

When the explosive mixture is allowed to burn upon a perforated plate or gauze, each perforation forms a separate flame which is very short, but has a large circumference. In order to burn as much gas as possible on unit surface, the perforations must be made close together, with the result that each small flame will tend to displace those near to it. The flame consequently sprays out as shown in Fig. 7. The spraying becomes a source of danger when the gases are under pressure, for while it is possible for each flame to appear to be burning properly when examined by the eye, yet analysis will show that the gas is escaping unconsumed. The reason for this was found to be that the flames on certain perforations in the plate were not burning properly, and this was especially the case with those perforations near the perimeter when small discs were used.

Further, the author noticed that with any variation in the size of the perforations, especially where some became enlarged and others closed with foreign matter, the length of the flames on dif-

ferent perforations varied, and the surface had peaks which stood out above the remainder of the flame. In cases where the design of the burner was faulty and the gas travelled down a main and then directly on to the perforated plate, the rate at which the gas was flowing through the centre perforations was greater than through those near the perimeter. The flames, therefore, projected in the centre. If any of the above uneven flames are made to impinge against a cold metal surface a part may be extinguished or only partially burned, with the result that the gas escapes combustion. This is aggravated by the fact that the pressure and the composition of commercial fuel gases cannot be maintained at a constant figure, and that the flames are frequently employed in some machine which is

GAS BURNER APPLICATIONS.

subject to more or less violent vibrations.

### Overcoming Difficulties

Many of the above difficulties are overcome by making the perforated plate or gauze concave on the side upon which the gas is burning, an arrangement which has been patented by Messrs. Wallwin and Sinnatt. The perforations should have a common focus, as in Figs. 1, 2, 3, and 6, which can be varied by varying the degree of concavity of the plate—generally the perforated plates are made in the form of small circular discs, the size varying with the type of burner for which the disc is required, but usually  $\frac{1}{2}$  in. in diameter. The perforations in small groups may have a focus of their own as in Fig. 4. The whole of the flames burning on each of the separate perforations are thus made to pass through a common point, or the flames are focused. The effect of this treatment is to overcome within wide limits any vari-

ations in the composition of, or the pressure of, the gas. It is nearly impossible for the gas to escape combustion owing to it having to pass through the common focus. The combustion of the gas is in a degree self-induced, and the rate at which the gas burns on the plate is increased by the thorough mixing which occurs. Differences in the size of the perforations cannot influence the flame to the extent they do on a flat perforated plate.

The flame upon a concave perforated plate or "dished disc" assumes a fairly perfect conical form, and after leaving the point of focus the burned gas is in a single stream. The point of focus of the plate may be considered to be the place at which complete combustion for the system will take place, and this may be taken as marking the point at which the flame may be brought into contact with cold surfaces. The distance this point is from the plate may be varied according to the design of the particular machine or plant in which the burning is required. The fact that the whole of the flames pass through the common focus causes that point to assume a maximum flame temperature. The degree of concavity required for different pressures and for fuel gases of different compositions was determined experimentally for the gases which have been burned by the system. The size of the perforations and the thickness of the metal of the plate are factors which influence the concavity necessary for any particular gas. At present the method adopted practically is to use small discs about  $\frac{1}{2}$  in. in diameter and to fit these into any type of burner; the number of the discs being varied according to the volume of gas to be consumed.—*The Engineer*.

**Annealing Iron and Steel.**—Two points have to be taken into consideration to make annealing really effective—the maintenance of a sufficiently high temperature, and the time period allowed for the changes in the structure of the metal to take place; the mere "drawing the temper" of a piece of metal by bringing it gradually to a red heat and then allowing it to cool gradually not really being annealing. A temperature of about 800 deg. C., continued for eight or ten hours, usually becomes necessary for really efficient annealing, and the use of a closed muffle having a reducing atmosphere is very desirable if oxidation is a matter of importance. Open muffles or ovens probably are easier worked than closed ones, and for some purposes are more economically worked, but the metal is too largely oxidised for many purposes, the oxide having usually to be pickled off.

## MACHINISTS' INSTRUCTION COURSE—XI.

By J. Davies.

**T**HE USE of mandrils for turning eccentrics is limited by the amount of the eccentricity and the size of the hole. It is clear that the centre for an eccentric with a large throw and a small hole would be too near the edge of the mandril to be practicable, and in many cases the centre would come outside the mandril altogether; in cases of this kind, also in turning crank shafts, special pieces are bored out a snug fit for the end of the

FIG. 45.

shaft and keyed on or fastened with set screws. These pieces are to receive the centres.

### How to Mark Off a Web Crank Shaft

The end of the shaft is centred and turned for a short distance the size of the end pieces that are to be used for carrying the centres, also a small portion is turned the same size at each end to sit in the blocks. The shaft is then placed in the vee-blocks on the surface table and the end pieces fastened on in line with the crank arms. The centre of the crank pin and the centre of the shaft are set the same height above the marking-off or surface table with the surface gauge, and a line drawn across the end of the shaft through the centre. The centre of the crank pin is on this line and can be laid off with a pair of dividers from the centre of the shaft.

For turning a large number of crank shafts or eccentric shafts with a very small throw,  $\frac{1}{8}$  in. and  $\frac{1}{4}$  in., the writer made some special jigs as follows:—

Two pieces of tool steel were bored a push fit for the ends of the shaft, one for each end. Then a piece of cold rolled steel, large enough to allow for turning, was driven into an old flange, after which the flange was faced and bolted to the lathe face plate. The piece driven into the flange is now turned to fit the two pieces already bored, they being the exact size of the cold rolled eccentric shafts, for which we are making the jig. Two holes for set screws are drilled and tapped at right angles to each other in the steel pieces A, Fig. 45. The screws are sunk below the surface and the holes

countersunk for a box wrench, to avoid accidents through projecting set screw heads.

The jig piece, A, is now fastened on to the turned mandril by the two set screws, which puts it under working conditions. Face the end true and smooth and make a very fine circle on the end with a sharp pointed tool equal in radius to the required throw of the eccentric shafts to be turned. Draw a horizontal line through the centre right across the face, and where the horizontal line cuts the circle is the centre required.

With this point as a centre make a circle with the dividers for setting up by, slacken the bolts with the faceplate and slide the job to the new centre, setting it very carefully to the circle made round it. Now make the centre with a tool and put in a very small drill to clear the point, repeating the operation with piece No. 2 for the other end.

Both pieces are now exactly alike, the only thing that remains being some ready method of locating them on the shafts in proper relation to each other. This is done by placing them on a short piece of shaft and setting them up by the horizontal lines on the planer or shaper and shaping a flat on one side of each piece, Fig. 46. To use them the jigs are placed on the shafts and the flat spots placed on lathe bed or planer, or any other flat surface, and the set screws tightened up, when the job is

FIG. 47.

ready to be turned. If the ends need turning, of course centres will have to be made in the shaft and the ends turned after the jigs are removed. The same jig pieces can be used for several different throws if the centres are not too close together.

### Chuck and Faceplate Work

Chucks can be considered as of two classes—independent, and universal. The

independent chuck is by far the most general of the two, as any kind of work within its capacity can be handled by it, but in special work, particularly repetition work, the universal chuck is a great time saver.

When putting on the chuck, don't start up the lathe and hold the chuck up to the thread, expecting it to catch true—it might, or it might not—with the result that the chuck would be torn out of your hands and hurled across the shop. Clean out the thread inside the chuck and oil the thread on the lathe spindle, start the chuck by hand and then start up the lathe, slowly if the chuck is heavy. Be careful not to bang it up to the end of the thread too hard, because it has to be taken off again. A convenient way to take it off is to place a bar or piece of pipe across the jaws and tighten one jaw on to it, then turn the lathe backwards and bang the bar on to a piece of hard wood resting on the ways.

In chucking the work, arrange to have the jaws opposite the strong part of the casting, if the casting is in any way frail, such as opposite the arms in pulleys, and so on. If the work is heavy, hold it up to the faceplate or chuck from the tailstock centre with a bar, pipe, piece of wood, or anything handy. In setting up the work, take all the surfaces to be machined into consideration and set up the work so that they will all clean up. Don't tighten the jaws too tight, it is surprising how easily a light piece of work can be distorted by the crank. Don't finish one part of the work before roughing out other parts. Rough out the work all over, and if you judge there is danger of distorting the job ease back the jaws evenly and slightly before taking the finishing cut.

Universal chucks are supposed to tighten true and even on any round piece of work, but they seldom do. Little variations of the chuck can be compensated for by placing pieces of paper or other packing between one or two of the jaws and the work. Special chucks are made in endless variety, and they are generally used for peculiarly shaped jobs, or for repetition work for setting up the work quick and true. They generally consist of a casting, bored and threaded at one end to fit the lathe spindle, and the other end made to hold the work, which is held by set screws or other suitable device.

### Bolting Work to the Faceplate

Bolting work to the faceplate affords ample scope for ingenuity. The same plates, clamps and packing pieces as were described under the heading of drilling machine work are generally used. The work must be clamped tight enough to prevent slipping or moving out of its place by the pressure of the tool, a good practice being to place a piece of brown paper between the work and the faceplate, angle plates, special clamps, adjustable jaws, etc.

It often happens when there are a number of pieces all alike that it pays to make some simple device for convenience in setting up. One example will be mentioned. It is required to bore out a number of cranks to dimensions given in Fig. 47, with the centres 5 in. apart. First bore out the 2 in. hole, then make a pin like a large, round-headed bolt to fit hole, with the shank to pass through the slots of the faceplates, leaving the head a little thinner than the crank casting to facilitate caliperling. Mark off the first crank, fasten the locating pin through one of the slots in the faceplate and set the 3 in. hole to the marks, checking the accuracy of the marking off by measuring the amount of stock between the two holes.

When the first one is satisfactorily set up, tighten up the locating pin, and if the job is at all likely to be repeated, put a couple of small dowel pins into it so that it can be placed in the same place. Now, by boring the 2-in. hole first and putting it on the locating pins, the distance between the centre is automatically fixed. Modifications of this idea can be used for a variety of jobs.

### THEORY AND PRACTICE IN SHELL BORING

ALTHOUGH comparatively little has been written on the subject, says *Herbert's Monthly*, there is hardly another on which such a diversity of practice exists as in the design of tools for boring and bottoming shells of the bottled and loose nose types. Shell boring can be done on lathes of the turret type; it can also be done on simple lathes by interchanging different boring bars in the same tool holder; or, again, by the simplest method of all, the shells may be passed from machine to machine, each of which is provided with one boring bar only. By any system of shell boring, it is, of course, assumed that the outside diameter of the forging has been turned true with the rough bore at a previous operation. This practice is so general that the reasons for it need not be gone into here. The shell may be held in any suitable type of chuck, but we have found that the collet chuck, shown in Fig. 1, is most suitable for shells up to and including the 6 ins.

size, which are regularly being dealt with by female labor. This chuck is extremely powerful, and does not require a great amount of effort to tighten.

#### First Boring Bar

The boring bar for the first operation is shown in Fig. 2; this carries two cut-

FIG. 1.

ters for boring the parallel portion in the shell. The two cutters are of simple form, made from rectangular black stock, and do not require to be machined. The front cutting edge is provided with suitable top rake, while adjustment for diameter is made by the screws A. In order to simplify setting the cutters to the correct diameter and equi-distant from the centre, the end of the bar is bored up a little way to take the stem of the setting gauge. The gauge is swung round the bar to each cutter

FIG. 2.

in succession; these are adjusted to touch the set screw in the gauge. The size to which the cutters are set is about .020 in. less than the finished bore. On larger shells, three cutters are sometimes employed in place of two where the diameter of the bar permits it.

Rough boring the parallel portion with a spade tool is bad practice, as it is obviously impossible to grind top rake on a spade tool in the correct direction for rough boring a parallel hole; in addition, the spade tool always tends to follow the rough bore of the forging.

#### Second Boring Bar

The second bar, Fig. 3, carries a spade tool which differs in one important particular from conventional practice. While being approximately to form, it has the front end made with a point like a flat drill, which makes it a good tool for penetrating; it also has the great advantage that it cuts through the scale gradually, instead of bringing a rough surface on to the rough bottom of the forging, as happens with ordinary spade cutters. The form on this cutter being only approximate, it is easy to grind, and its diameter is a little less than that of the rough bore, so that it only starts

cutting when it reaches the bottom of the hole; the stops are set so that this cutter penetrates deep enough to remove all scale.

#### Third Boring Bar

The third bar, Fig. 4, carries a correctly shaped spade cutter, which, in ad-

FIG. 3.

dition to finishing the bottom of the shell, usually finishes the parallel bore, the cutting action closely resembling that of a reamer. A feed of 10 cuts per inch can be used for finish boring, this leaving an excellent finish, as the cutter removes very little metal. To steady the cutter while working at the bottom of the hole, and to prevent it "chambering," the finish boring bar is provided with a cast iron roller, which runs close behind the cutter, and fits in the finished bore. Four flats are milled on the roller.

FIG. 4.

so as to allow the chips and lubricant to get past. In setting the stops for the finishing operation, the end of the spade cutter should not be allowed to penetrate any appreciable distance beyond that reached by the spade drill, so that the "dead end" of the cutter only comes into operation just at the end of the cut.

There have been a good many attempts to eliminate the dead end in the manufacture of spade cutters, the object being to secure a cutter which penetrates more easily, but it is obvious that with a first spade tool, like that in Fig.

3, the dead end on the finishing spade tool is not objectionable. It is our practice to make the land or dead end about one-tenth to one-eighth of an inch wide, which we find is quite satisfactory. Cutters with narrower lands than this will not stand much heavy work.

### Eliminating the Dead End

Three designs which eliminate the dead end are shown in Fig. 5, but they are all open to objection. The cutter A is too weak, and will readily split up the centre. That shown at B is a good cutter for penetrating, but unless very carefully ground leaves a pip at the centre of the bottom, which is objectionable in finishing cutters. The cutter shown at C has no dead end, but is also liable to leave a pip, while owing to the cutting being heavier on one side than the other, has a tendency to chamber the bottom of the hole.

The readers' attention is drawn to the details of the spade tool shown in Fig. 6, which we now use. This design is produced on the Lumsden oscillating grinder, and is cheap to manufacture. The cutting edges are radial, as is usual,

FIG. 5.

but the clearance is obtained in a somewhat different manner from the usual practice. In order to obtain a more obtuse and durable cutting edge, instead of giving the usual 6 degrees clearance, the outside edge is at right angles to the top face, and the heel is removed where it touches the circumscribing circle. This is done for both roughers and finishers, but, in addition, the finisher is circular ground to the size of the hole with a land of about 1/32-in. wide, which lengthens its life and assists in preventing "chambering." The process of circular grinding also provides a convenient and accurate method of finishing the periphery of the cutters to size. Finishing cutters which have worn under size on the periphery are usually converted into roughers.

It is very good practice, if the lay-out will allow of it, to finish the parallel bore with another bar, exactly like that shown in Fig. 2, leaving the spade cut-

ter, Fig. 4, to do the bottoming only. In this way a finishing spade cutter which has worn under size on the periphery need not be discarded for that reason.

For facing to length and chamfering to suit the bottling die, a bar like that shown in Fig. 7 is used. By using a single point cutter at A it can also be used to bore the thread diameter of shells with loose nose. The pilot roller fits in the finished bore, while a facing cutter and chamfering cutter are clamped in a collar on the bar. A chamfer is often put on shells with loose nose, in order to centre them in the chuck used for the thread milling operation. In shells of the loose nose type the recessing at the back of the thread can be done with a slide of conventional pattern; this operation calls for no comment.

### EFFICIENCY IN METAL POLISHING

By "Abe Winters."

**W**E read more or less good advice regarding efficiency in the plating department, but very little is written relative to the economical treatment of the metal in the polishing and buffing departments previous to and following the interesting process of electro-plating. The following is based on statements made to the writer by one of the most progressive foremen polishers in the Province of Ontario. His long and varied experience has given him opportunity to study the metal polishing problems from many angles, thereby lending exceptional value to the opinions herein given:—

#### The Plater and Polisher

The polishing and plating of metals for all ordinary purposes is often unfortunately regarded as being a trade or profession which may ordinarily be mastered by any one man who may be capable of becoming an adept in either one or the other of above-named operations. Under certain restricted conditions this is true, but, generally speaking, a good polisher seldom develops into a good plater, and a man who studies the art of electro-plating until its possibilities have been properly grasped, seldom, if ever, becomes an efficient metal polisher. The two occupations are essentially quite remote from one another, although closely allied. In many industrial plants devoted to the manufacture of polished and plated wares, the polishing and plating is done under the supervision of one man. Such, however, is not the case in plants turning out high-grade lines of metal wares, which have become standard in respect of finish and durability of the electro-plate. These plants have realized the importance of employing foremen for the respective departments who were specialists in their particular branches of the business.

To be successful, these men should not however be averse to actually engaging in the various operations under their supervision when circumstances require it. Wet or soiled hands are not neces-

FIG. 6.

sarily a brake on a foreman's efficiency. If the polisher is given new parts to polish and does not readily adopt the quickest and best method of finishing the operation, the foreman should be ready and willing to demonstrate the process he wishes employed. If a price is placed on piecework, the foreman should be capable of trying out the time on a given number of pieces and show the men that the work can be finished in the specified time. Foremen who depend on some favorite employee to perform the above duties for them seldom, if ever, become highly efficient and capable of supervising departments in the more modern, systematized industrial plants. The foreman must teach his men to keep their wheels in first-class condition, properly balanced, etc. Many polishers are very careless with the supplies, and consider the operation of balancing their wheels a trivial matter, with the result usually following careless, thoughtless action—inefficiency. They are not responsible for the supplies, and do not intend to use their grey matter in an effort to assist the foreman; therefore, it behooves the latter to be on the alert in order to keep the burden rate of his department low. The cause of much carelessness on the part of the polisher when balancing wheels is that he will not take the time to balance them; yet he knows, or at least should know, that unbalanced wheels cause the waste of many dollars' worth of emery and glue in a very short time. If felt wheels, canvas wheels, or bull neck wheels are

FIG. 7.

used, the waste is often extremely expensive and totals to a big sum at the end of a year.

The foreman polisher who studies his men, selects the work for them according to their respective abilities, exer-

cises proper discipline, and treats his men as human beings, and with impartiality, can usually maintain a low figure for operating expenses. He must experiment, but thoughtfully. The burden rate and cost rate should always be his guide. He must endeavor to produce the best possible results with the least possible expense, not only at this particular time, when men and material are scarce and costs for labor and supplies run unusually high, but at all times. The foreman should strive to produce the maximum output at the minimum expense to his employer.

Polishing is not, and never has been, regarded as an operation requiring exceptional skill. It is an occupation which necessitates spending the working hours in a more or less distasteful atmosphere. Often the conditions are actually a menace to health; the labor is indeed tedious even on light work. Polishing rooms are not usually as bright and cheery as they should be. Grease, oil and dirt are well known factors in the process of polishing, but their influence on the daily life of the men can be wonderfully modified by consistent thought and attention on the part of the foreman. The sanitary conditions existing in the polishing room should be maintained satisfactorily throughout the year if best results are expected of the men.

#### Polishing Room Amenities

A suction system of adequate capacity, together with true running lathes, equipped with suction hoods, are very essential if the production of maximum output per day is desired. Air laden with fine particles of metal, emery, dirt, and glue, is not conducive to healthy human organisms. Too many polishing rooms are deficient in ventilation, and a still greater number are without proper and efficient blower systems. The men at the wheel naturally expect the foreman to observe deficiencies and have them corrected. If the men have reason to believe the foreman is an unobservant easy-going kind of chap, they soon learn to take many advantages of his carelessness, and gradually the control of the situation is transferred to the shop committee of the local Polishers' Union. A foreman polisher should divorce himself from the Polishers' Union as soon as he becomes a foreman, and while he may long retain a warm spot in his heart for the organization which at one time dictated to him a programme of action, as a foreman he should execute the orders of his employer with judgment and impartiality.

Much of the foreman's difficulties may be eliminated by special attention being given to the class of supplies he orders. He should try out all samples of wheels and material personally, in order to know the grade best suited to his

specific requirements. The supply salesman will invariably tell him that a certain line of supplies are absolutely the best on the market, and name over a half dozen firms who are using the stuff. Perhaps he is right, but he seldom has every article up to the standard; therefore, don't take the supply salesman's word, or that of anybody else. The foreman should find out himself. Purchasing agents many times place an order according to first cost—the lowest price. This is wrong. A low price is a poor guide. Expensive goods are also often useless for the purpose, and furnish trouble for the men. High prices cannot be taken as a guarantee of efficiency. A personal test will suffice to give the foreman a basis upon which to figure, as he can then reckon the costs from various angles.

Above all, don't stay in a rut; experiment, think. If you are polishing brass and take it from 120 emery (dry) to the buff, and cannot satisfy yourself that this method is best, try oiling the brass, using a compressed canvas wheel; 95 per cent. of the brass work polished can be treated with less expense in this manner. Felt wheels are often very inferior. They are almost invariably out of true, and the use of compressed canvas as a substitute has frequently lowered the burden rate in the polishing department very noticeably.

When refinishing plated goods, it is excellent economy to have the old plate stripped off by electro-chemical methods in the plating department, thereby saving time, material and labor. Stripping solutions, which permit both steel or brass to be cleaned of old deposits without injury to the base metal, are now in general use, and the polishing department should be benefited by the process.

The above points do not cover the entire range of economic ideas which should be employed in the polishing room, but they are some of the prominent ones, and their adoption will assist the foreman to appreciate further views on polishing room efficiency, which will appear in future issues.

#### INDUSTRIAL LIGHTING

AS to whether the supply of current in the case of a large industrial establishment should be taken from a private plant on the consumer's premises, or from the public supply, is a question which has often been raised, but never definitely settled. It has again been discussed before a meeting of the Junior Institution of Engineers. The central station man is, or should be, a salesman, and is entitled to use all legitimate means of pushing business. Such items as the first cost of a generating plant, interest and depreciation thereon, and the need of skilled labor to look after it, can readily be used as a means of

suggesting to the lay mind that to take the supply off the public supply mains is the only economical thing to do.

This does not necessarily follow, however, and essentially so in the case of establishments where a power plant is put down. The additional cost of making provision in the power plant for supplying the lighting current is commonly such as to render it well worth doing on economical grounds, whether the plant be for the distribution of the power mechanically or electrically. With a supply from his own plant the owner has not to watch possible variations in the annual cost of current due to such causes as minimum or maximum demand, total units consumed, etc., nor to enter into any agreement for a number of years in order to get down to what may appear to be a favorable rate for supply.

#### Question for Individual Consideration

The whole question must be thought out in an unbiased way, due regard being paid to all the conditions affecting the particular case under consideration. In settling upon a supply from the public service, the factory owner is frequently well in need of independent advice as to agreements for charging, if the most economical arrangement is to be arrived at. When a typical agreement is put forward for consideration before the prospective consumer can be advised as to taking up same, it is necessary to weigh very carefully the several conditions which are commonly sought to be imposed. Such, for instance, are requirements that all the consumer's lighting must be taken from the one source of public supply only, and this for a period of, say, three, five or more years.

Further than this, the rate of supply and system of charging are both fixed for the whole period, regardless of possibilities which might prove advantageous if they were open to be adopted. Supply authorities frequently offer alternative methods of charging, usually a flat rate; a maximum demand system is also one of its several forms. With a combined power and lighting load, it is not unusual for a consumer to be allowed to have a certain proportion of the total units consumed, of perhaps 10 per cent. to 15 per cent., to be allocated to lighting, any proportion above this being charged at a somewhat higher rate. In factories where the load is mainly power, this works out very satisfactorily for the consumer, and likewise, no doubt, to the supply authority.

#### DOMINION COPPER PRODUCTS CAPITAL INCREASE

THE Dominion Copper Products Co., for the second time in four months, has secured authority to increase its capital,

this time from \$1,000,000 to \$3,500,000. The company is one of two successful subsidiaries organized by the Dominion Bridge Co. since the war began. It started off with a capital of \$400,000, which was increased last August to \$1,000,000. Now, by supplementary letters patent just issued at Ottawa, authorization is given for an increase to \$3,500,000. The other subsidiary, the Montreal Ammunition Co., so far as is known remains with its original capital of \$300,000, although that is absurdly small relative to the actual cash investment in the enterprise and the volume of business the company transacts.

It has been conjectured for some time that the Dominion Bridge directors have some plan for the consolidation of the two subsidiaries under consideration. A possible step towards such a consolidation exists in the increase in the capital of the Copper Products Co., which could give its shares in exchange for Ammunition Co. shares on a basis approved by the parent concern, which owns the controlling interest in both.

### OCCUPATIONS FOR CRIPPLED SOLDIERS

By Sir Edmund Walker\*

THE end of the war is not in sight, but the wounded and otherwise disabled soldiers are coming back, and it is not too early to come to close grips with the problem of finding employment for those who have no claims on previous employers, and of caring for those who are partly or completely disabled.

We have to consider what we owe to the man who has fought to defend our lives, our property and our liberty, and we have to consider how to prevent the disorganization of industrial society when the soldiers come back in large numbers and the making of army supplies has come to an end. We do not wish the soldiers' home-coming to mean, except perhaps temporarily, a cause of industrial disturbance. We want, on the contrary, to find in it a great opportunity to increase the prosperity and happiness of that part of the Empire which they have fought to save.

We shall have lost forever the laboring power of our heroic dead and of those few who are totally disabled. We shall have gained the labor of many women untried before the war; we shall have gained the added strength, physical and mental, of countless soldiers who through the war have "found" themselves; and we shall, in much fewer cases, have returned soldiers who are more or less wrecked physically or mentally, but who are not quite useless to the community.

I presume much of the work to be done by the Military Hospitals Commission leads directly to the larger work of land and industrial settlement. For obvious reasons we shall hope that many of the returned soldiers will take up land. The manner of selecting such land so that communities of loyal men shall be planted in every province, of caring for the soldier-farmer in his early years of settlement, and of lending him money for improvements, is of prime importance.

Meantime the Hospitals Commission has, added to its other burdens, the duty of making suitable for work, by training and by the use of newly invented implements, men who would otherwise in many cases be a charge upon the country and a monument of our ingratitude.

In my younger days the one-legged and one-armed soldier was always present, eloquent of war, and not without a meaning to the community,—“lest we forget.” We were used to seeing a bank-messenger with one sleeve pinned to his breast and his handsome commissionaire coat covered with medals.

### Handicapped, But Not Disabled

To-day, every employer of labour, manufacturer, merchant, banker, or whatever his calling, should be considering how he can employ a few partly disabled men, and thus do something more in carrying the burdens of the war.

Many a machine shop can use a certain number of one-armed and one-legged men with hardly any loss of efficiency. The Hospitals Commission sends them out better prepared to lessen the effect of their disabilities than the wounded soldiers of other wars.

In a recent campaign to raise money for the British Red Cross, two officers totally blind from the effect of wounds appeared before the public. Both had been trained in the wonderful establishment in England administered by Sir Arthur Pearson. One of these blind officers is now employed as an expert electrician, while the other is a competent actuary and already engaged in soliciting life insurance.

Totally blind men are being trained as stenographers, taking shorthand notes by a system which enables them to be read by touch before being typewritten by the same blind operator. Some of these men are already much more efficient than the average stenographer.

What the peaceful communities at home must bear in mind is that these men are not rendered unfit for useful work but that they are handicapped or forced by the loss of one limb or sense to put more energy into their remaining abilities.

All the ingenuity of this ingenious

age should be employed, no matter at what cost, to enable the wounded soldier to earn his own living,—which will not affect any pension he may receive.

When everything that human skill and sympathy can do is done, we shall still have some men to be entirely taken care of by the state. I hope that in creating Soldiers' Homes for these, as well as in finding good work for all not totally disabled, we shall completely revolutionize the past and make the name of Canada shine brightly for its wisdom and its humanity in caring for its crippled heroes.

### CONSERVATION AT THE FRONT

EXAMPLES of some of the enormous wastages of war are furnished by the statement of a civilian whom business connected with the British War Department recently took to France. Describing a visit to one of the military bases, he says he met with many surprises. The first was to see a huge mound of broken bicycles, odd wheels, parts of tires, etc., on which a number of men and women were hard at work sorting out and taking away the various materials in sections. The good parts were fitted together and reconstituted as bicycles in a factory at another part of the town.

Another scene in that place was a small mountain, about 200 feet square, of old army shoes. They were of different kinds and in all conditions, covered with mud from trenches, some well worn, some new and badly cut, and some almost unrecognizable as shoes—many of them cut or taken from the feet of dead or wounded men. That mound of shoes would have made a strange footnote to “Sartor Resartus.” Workers were busy cutting about these shoes, salvaging the sound pieces and sending them to a factory.

There were many such heaps and shedfuls of other war salvage, which were carefully examined and dissected for further usefulness. The most unexpected of the many instances of these economies was a shedful of damaged binoculars. There was something very grisly about some of these glasses. Some had one lens whole and the other smashed by a bullet which had gone right through. Some of the binoculars had been struck in the centrepiece and completely divided, although all the lenses were uninjured. Others were twisted and flattened as if squeezed by a giant's hand. It is easy to see the great value of these recovered lenses at a time like the present, when the supply of field glasses is one among many army problems.

With all the new-fangled “whatnots” and the patented “time-savers,” thinking still has to be done the old-fashioned way.

\*President Canadian Bank of Commerce.

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## MECHANICAL PLATING BARREL

**A** PLATING barrel possessing a minimum amount of mechanism with the maximum amount of convenience and efficiency is shown in the accompanying illustrations Figs. 1, 2 and 3, which show a mechanical plater recently brought out by the Connecticut

suited for the work, being hard, strong, non-conductive, non-absorbing and chemically inert. Its nature is such that very small perforations may be used, enabling work to be plated which is too small to be done in a wooden barrel.

The barrel is revolved by means of a belt pulley driving through a train of gears mounted eccentrically to the main bearing, the gear train being thereby disengaged when in a raised position. Brass lifting arms, covered with hard rubber for insulating purposes are employed to lift the barrel from the solution as well as conveying current to the cathode, or work rod, which consists of a single brass rod which is supported at the bottom of the barrel to insure proper contact between the work and the rod.

The anode rods are of  $1\frac{1}{4}$  in. brass tubing connected together and provided with terminal connections. Either curved or straight anodes may be used with equally good results.

The Rotoplater, as the machine is termed by the makers, has no

stuffing boxes to leak, and two speeds of 6 and 11 revs. per min. are obtainable by simply shifting an arm. The barrel being entirely submerged

in the solution, it may be filled two-thirds full of work at one charge. Although the barrel can be lifted free of

FIG. 1. SECTIONAL VIEW OF PLATING MACHINE SHOWING BARREL IN POSITION SURROUNDED BY ANODES.

Dynamo & Motor Co., Irvington, N.J. It is built in three sizes—82, 98 and 114 gals., with a barrel  $14\frac{1}{2}$  dia. x 24, 30 and 36 in. long respectively.

The apparatus as shown consists of a tank made of 2-in. Southern cypress, well bolted together and lined with a mixture of asphaltum and pitch. Two styles of barrels are made, that shown in Figs. 1 and 2 being built of a large number of 1 in. thick strips with perforations 3-16 in. square; this barrel is well adapted to the plating of large or medium-sized work and for heavy pieces that would break the panels of weaker barrels. It is obtainable in hexagonal as well as cylindrical form. Fig. 3 shows a hexagonal barrel with panels of Bakelite, a manufactured substance which is eminently

FIG. 2. BARREL RAISED CLEAR OF TANK FOR REMOVING WORK, GIVING ACCESS TO LIQUID.

the tank and the work conveyed in it to the washing tank and dryer, it is not removed from its bearings which are thereby properly seated at all times.

The complete outfit includes pulley, lifting chain, block and fall, and can also be supplied with a self-contained motor drive instead of belt pulley.

## AUTOMATIC PICKLING AND CLEANING MACHINE

THE machine shown in the accompanying illustration represents a recent development in apparatus for automatically pickling, cleaning and drying all kinds of small articles of various materials and requiring a number of different solutions. The revolving member consists

FIG. 3. HEXAGONAL BARREL WITH BAKELITE PANELS

of a number of perforated drums dipping into tanks containing various solutions, the last drum being the drying section. A speed of 10 rev. per min. is imparted to the drums, which are inclined downward so that the material advances gradually

work, is shown in the accompanying illustration. The  $\frac{1}{2}$  in. dia. tool is clamped in a split holder forming part of a swivel block, which is mounted in the fork-shaped casting which carries the shank. The clamping arrangement is

makers of this tool are the Pierce Machine Tool Co., Chicago.

AUTOMATIC PICKLING AND CLEANING MACHINE.

from one end to the other. Pick-up pockets transfer the work from one drum to another, the material going through the machine and being delivered without interruption.

The apparatus can be used for a variety of work, including the removal of scale from cartridge shells, electric light sockets, etc., leaving them clean and dry ready for the next operation; nails, screws and similar small material can likewise be treated in oil. Uniform and increased output is a feature of this apparatus, two men with a medium size machine having as large an output as ten men with a battery of tumbling mill.

The makers of this machine are the U.S. Electro Galvanizing Co., Brooklyn, N.Y.

#### ADJUSTABLE BORING TOOL

AN adjustable boring tool, designed for using forged cutters on general boring

work, is shown in the accompanying illustration. The  $\frac{1}{2}$  in. dia. tool is clamped in a split holder forming part of a swivel block, which is mounted in the fork-shaped casting which carries the shank. The clamping arrangement is positive, and enables the tool to be easily adjusted to the required size. When it is required to increase the size of the hole bored, it is only necessary to loosen the collar screw and make a slight adjustment of the set screw, whose point seats on an incline, which forces the swivel block outward and moves the cutting tool to the point required.

As a result of this swivelling adjustment in a horizontal plane, the cutting point is always level with the centre line. Two sizes of this tool are obtainable having 1 in. and  $1\frac{1}{4}$  in. shanks capable of boring holes of a maximum diameter of  $1\frac{1}{2}$  in. and 2 in. respectively. The

ADJUSTABLE BORING TOOL USING FORGED CUTTERS

#### GENERAL PURPOSE LATHE

TO meet with the requirements of a lathe for existing demands of munitions work and possessing the constructional features for subsequent adaptation to general purpose uses, H. J. Armstrong, Markdale, Ont., has placed on the market the type of machine here illustrated. In designing, the makers have endeavored to obtain maximum rigidity and large wearing surfaces. The drive is taken on a single pulley and communicated to spindle through cut steel gears and intermediate shaft.

When equipped with full geared head, eight speed changes are obtainable; controlled by levers within easy reach of operator. Provision is made for a complete range of feeds controlled by operator without changing on or off machine of any gears in system.

The apron has double wall. A turret or single boring tool can be supplied in place of tailstock. The machine can be

GENERAL PURPOSE LATHE.

supplied in two sizes, 20 in. for shells up to and including 6-in., and 32 in. for all larger sizes of shells.

#### NOVEL SHEET-SHEARING APPLIANCES

A LINE of cutting tools of maximum strength and minimum weight and possessing sufficient portability to be taken to any part of a job, are being built and marketed by Montgomery, Smith & Co., Ltd., Keynsham, Somerset, Eng., the outstanding feature of the design being the use of rotary cutters which are self-feeding when in use.

The principle of operation is shown in Fig. 1. Two revolving cutters are used, the lower one being freely mounted in a stationary bracket. The upper cutter is carried in a similar bracket which can be adjusted vertically so as to overlap the cutters more or less according to the gauge of metal being cut. This cutter is driven by a ratchet lever with adjustable stroke connected by links to the

hand lever. The surfaces of the cutters adjoining the edges are knurled so that movement of the hand lever causes the two cutters to draw the work toward them so that it is sheared, the ratchet allowing the cutters to remain steady while the hand lever returns for another stroke.

To facilitate proper operation of the machine, a setting gauge is supplied, either end of which is placed between the cutters, according to thickness of stock being cut, thus insuring the sheet being cut with the least possible distortion and power. In the case of thin sheets the cutters are set either level or slightly overlapping.

The variable leverage provided by the slotted ratchet lever enables the stroke of the driven cutter to be increased on light work, while partial cuts as in corner work are facilitated by releasing the upper cutter which allows the sheet to be easily withdrawn. The machine illustrated weighs 60 lbs., and has a capacity of 3-16 in. in steel and  $\frac{1}{4}$  in. in

used which is dispensed with when used as a bench machine. When using this type for corner work, etc., where partial cuts are made, the sheet can be instantly released and withdrawn by sim-

FIG. 2. PORTABLE TYPE OF ROTARY SHEAR.

ply pulling over the eccentric adjustment screw on top of machine. Lateral adjustment is provided for the cutters, which may be removed for re-grinding when worn. This machine weighs 8 lbs., and cuts up to 3-32 in. in steel and  $\frac{1}{8}$  in. in softer metal.

A special corrugated-sheet cutting tool is made on the same principle, which is self-feeding and cuts either straight, curved or obliquely across corrugated sheets without distortion. It weighs 5 lbs., cuts up to 20 gauge sheets and is compact enough to be carried in the pocket. Double-edged cutters are employed, which remove a feed strip from the stock in front of the cutter as it feeds into the work, this tool being also withdrawn at any point as required.

#### WELDING TOOL STEEL TIPS TO MACHINE STEEL SHANKS

THE present cost of high speed steel has not only made it prohibitive for the average shop to use cutting tools composed wholly of such material, but causes serious loss when worn out tools have to be scrapped. Noticeable economies in this field can be effected by welding high speed steel tips to ordinary

machine steel shanks, old worn out tools being cut to size and utilized for tips.

The Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., have developed this process to a considerable degree, using their regular electric arc welding equipment used for welding and repairing castings in ordinary work. The current for this work should be approximately 100 amperes and the voltage for the welding circuit 60-70 volts.

The high-speed steel tip is first "tacked" to the machine steel shank, and the whole preheated. After fluxing with borax, welding is started. After welding, the tool is immediately laid in mica dust to cool gradually. It is then given a first grinding and tempered, after which the finish grinding is accomplished, when the tool is ready for use. The illustration shows the various steps in the process—1, tip "tacked" to shank; 2, tool after welding; 3, after first grinding, and 4, tool ready for use, after tempering and finish grinding. Tool numbered 5, was tested for strength of

SUCCESSIVE STEPS IN THE PROCESS OF WELDING HIGH-SPEED TIPS.

weld by hammering. As will be seen it broke above the weld. The reinforcing metal which is built out and around the tip serves both to give larger radiating surface and afford a larger conducting path back to the butt of the tool, thus

NORWAY IRON ELECTRODE WITH OTHER ITEMS OF WELDING EQUIPMENT.

FIG. 1. SELF-FEEDING ROTARY HAND SHEAR.

softer metals, the actual space occupied being  $11\frac{1}{2}$  in. x 7 in.

A combined portable and bench type is shown in Fig. 2, the lower view showing it in use with a bench adapter while the upper shows it floating on the sheet, in which case a guide handle is

keeping down the temperature at the cutting edge. The machine steel shank may be of any length desired, and of cold, hot rolled, or carbon steel, while the high speed steel tip should be short.

The work should not be hurried, but a good operator should be able to make

between 25 and 30 welds for tools of  $1\frac{1}{2}$  inch cross section, in a day of  $9\frac{1}{2}$  hours.

### PISTON THROTTLE VALVE

THE throttle valve here featured has been specially designed by Lancaster & Tonge, Pendleton, Manchester, England, for controlling the admission of steam to winding, hauling, and reversing rolling mill engines, with the minimum of exertion on the part of the attendant. As will be seen from the sectional illustration, the valve is of the piston type with a single seating, steam tightness being effected by means of four ordinary piston rings of rectangular section, while it is balanced sufficiently for all practical purposes. In order to give the finest possible regulation of the steam and very gradual admission at first, the

PNEUMATIC POWER SQUEEZER MOLDING MACHINE.

The maximum air pressure is controlled by an automatic valve which shuts off the air at any required pressure, adjustment being made immediately to any desired pressure.

Five sizes of this machine are built with cylinder diameters ranging from 8 in. to 16 in., and tables 16 in. x 16 in. to 24 in. x 36 in., all of the machines operating with air at 80 lbs. pressure per sq. in., giving total pressures of from 3,800 to 15,360 lbs.

THE phenomenon of radio-activity is not confined to radium. A product of thorium, known as radio-thorium, is intensely radio-active, but it has a much shorter life than radium, its half period of existence being estimated at only three of four years. Meso-thorium,

HIS MAJESTY'S CANADIAN TORPEDO BOAT "GRILSE" AS SPEED PLEASURE YACHT.

seating is formed with an annular collar, the inner surface of which is made slightly tapered, so that the passage for the steam is somewhat constricted until the valve is lifted clear. When used in connection with colliery winding engines, the valve lever is fitted with a weight or spring to cause the valve to close sharply, in case the over-winding gear comes into action.

lower part of the side members. The cross-arm carries the operating valve and control apparatus, these being clear of sand and convenient of operation.

from which radio-thorium is evolved, is a by-product of the incandescent gas mantle industry, and on account of its relative cheapness as compared with radium it is now being used extensively either by itself or combined with radium, in the production of self-luminous paints.

### PNEUMATIC POWER SQUEEZER MOLDING MACHINE

A POWER squeezer of simple construction and efficient operation, designated as model "D," has been placed on the market by the J. F. Webb Mfg. & Supply Co., Davenport, Ia. It is designed to meet the high-speed requirements of present-day foundry operation, being so simplified that risks of breakdown are reduced to a minimum.

The main frame is formed of two side members connected by the cylinder casting, the strain rods which support the upper cross-arm being hinged to the

SECTIONAL ELEVATION OF PISTON THROTTLE VALVE.

### A TAIL SEEMED LACKING

DRESSED in the latest and most approved motoreycling costume, with goggles all complete, the motorcyclist gaily toot-tooted his way by Regent's Park towards the Zoo. Suddenly he slackened, dismounted, and said to a small, grubby urchin: "I say, my boy, am I right for the Zoo?"

The boy gasped at so strange a sight, and thought it must be some new animal for the gardens. "You may be all right if they have a spare cage," he said, when he could find his tongue, "but you'd ha' stood a fa' better chance if you'd 'ad a tail!"

### AN ADDITION TO MACHINE SHOP NOMENCLATURE

**A**N OPPORTUNITY would seem to present itself to some resourceful mind which could evolve a convenient and obvious name for lathe, planer and similar tools in which a low carbon or machine steel shank is fitted with a cutting edge of tool steel welded in place. The necessity for having a suitable name for such tools will become more apparent when the price of tool steel returns to a normal figure again, and the tendency will be for many people to again use the solid tool steel article.

Recent developments serve to show that the design of cutting tools has been reduced to a point where specified forms of tools can be produced by more or less unskilled labor with an accuracy and economy of both labor and material which renders obsolete the combined efforts of high priced lathe-hand and dogmatic blacksmith, each of whom had individual ideas regarding the design and forging of tools respectively.

Progressive shops will, however, find that more than 90 per cent. of their tool requirements can be efficiently met by tools of the "composite" type having a "base" metal shank and a "rare" metal edge. The successful application of non-ferrous metals to cutting work is, so far, confined to an alloy which has earned a considerable degree of success, but the adaptability and universality of production possible with tools of the tipped type presages a widespread use in times to come.

Tool-holder sets with interchangeable tips have attained a justly deserved popularity and the probability of all three types,—solid, composite and holder, being handled together in a tool room would seem to be sufficient reason that a single word if possible be adopted as a generic term for tools of this type. The word composite has been used to show the type of word and its distinctive application. A word compounded of recognized words would be preferable to a manufactured word which by nature of its possible obscurity of application would not readily indicate the new type of tool.

### THE "GRILSE" NEAR-TRAGEDY

**T**HE fact that H.M.C. torpedo boat Grilse managed to make port after being battered and bruised to the point of foundering with all hands, is due in the first place to her soundness of construction at the hands of her builders, and secondly to the herculean efforts of the crew to keep her afloat by hand pumping and baling, even

when all hope of rescue seems to have faded. To those familiar with the appearance of the vessel—a very good idea is to be had from our illustration, and bearing in mind the fact that she is but a converted yacht, it seemed almost like courting disaster to have her put to sea—especially on the Atlantic, in midwinter. If we will have a Department of Naval Service, then let us have the proper vessel constituent to undertake its work. At the moment we can ill-afford to lose the six members of the crew of the Grilse, although it was nip-and-tuck that the loss wasn't fifty-six.

We might have afforded to lose the ship, but not so the men, and it seems to us that, after the recent experience, definite steps should be taken to ensure that the Grilse be put on a service which will harmonize with her original design idea, and that if circumstances demand the presence of a speedy torpedo boat destroyer or destroyers on our coasts, these be procured immediately from Britain, where the matter of half a dozen transferred to Canada would neither minimize the effectiveness of nor impoverish the main auxiliary or supplementary fleets. As has been aptly said, when not a few million dollars are being spent meantime on war-time non-essentials, our Dominion Government would be well advised to divert say a couple of millions to the purchase of a trio of destroyers, the most modernly and effectively armed and the speediest that science and the wit of British marine engineering skill can produce. A low-lying rakish craft with a short, stocky stack or two, and a wireless mast, no matter her speed, if originally designed as a novelty in pleasure yachts, is impossible of conversion to a place in the torpedo boat class, and the man-in-the-street should not be the only possessor of such knowledge.

### PEACE PROPOSALS A DISTURBING ELEMENT

**T**HE spectacular announcement by the Central Powers that they are willing and ready to put forward and discuss terms of peace with the Allies has, as might be expected, received a somewhat mixed reception, not only by the latter, but by neutrals as well. Whatever the spirit prompting the proposals and whether their meantime initiation will form the starting point for ultimate cessation of hostilities and all-round satisfaction in territorial and other settlements, are of course matters well beyond even the foresight and skill of most expert diplomacy. Time and tact will necessarily be the all-determining factors, and as regards effect on industrial and commercial enterprise the world over, the former is likely to give opportunity for the display of many disturbing—perhaps panicky demonstrations.

Even already, business has been materially affected, adversely, and this in spite of the fact that well-informed opinion is quite definite on the inopportune of peace negotiations. So far as we in Canada are concerned, all indications point to our having little more than grasped the full appreciation of our material aid requirement in the prosecution of the war. We have come to realize that even with twenty-nine months of war behind us, the struggle is not more than half way through, therefore anticipating the complementary period our plans bespeak war work rather than peace talk. The business world is experiencing its first peace shock, so to speak, and the probabilities are that there will be many such in the coming year; but as evidences of an approaching termination of hostilities from a variety of reasons, they need not be unwelcome, tending as they will towards a less disturbing readjustment to peace time pursuits than otherwise. Taken at their face value, the peace proposals as meantime put forth add but further incentive to our expressed purpose of still further aiding the Empire and its Allies.

## INDUSTRIAL NOTABILITIES

**C**LAYTON R. BURT, M.E., assistant general manager and director, Russell Motor Car Co.; director, Canada Cycle & Motor Co.; director, Machine & Stamping Co., was born in Lynn, Mass., Dec. 17, 1875, son of Byron S. and Laura Burt, of St. Johnsbury, Vt. He received his education at the Grammar School and the Academy (M.E.), St. Johnsbury, and entered on a business career as apprentice to the Brown & Sharpe Mfg. Co., Providence, R.I., remaining with that firm for twelve years, during which he filled a number of important positions. He went to Europe in 1900 in the interests of B. & S. For eight years, from September, 1905, he was general superintend-

CLAYTON R. BURT, M.E.

ent of factory, and manager of small tool department of the Barber-Colman Co., Rockford, Ill., for whom he designed and developed the Barber-Colman gear hobbing machine.

In August, 1913, Mr. Burt came to Toronto as factory manager of the Russell Motor Car Co., being promoted the following year to the position of assistant general manager and elected to the Board of Directors. During 1914 he travelled in Europe, investigating the manufacture of sleeve type motors. In 1909 he was elected a member of the American Society of Mechanical Engineers, and in 1914 he received membership in the Society of Automobile Engineers, New York City. As might be expected, Mr. Burt's expert mechanical engineering knowledge has been of considerable value to the Russell Motor in their wide variety of munitions production.

He married Carrie A. Eddy, daughter of John F. Eddy, Providence, R.I., August, 1896, the family consisting of two sons. His clubs are: National, Ontario, Lambton Golf and Country, Toronto; his societies—A.F. & A.M., Winnebago Chapter, Crusader Commandry Freeport, Consistory, 32 degree Potentate Mystic Shrine, Tebula Temple, Rockford, Ill., 1913, and his recreations motoring and golf. In matters of religious creed he is Methodist Episcopal. His residence is 312 Indian Road, Toronto, Ont.

market, production continues with unabated energy. The market will undoubtedly pass through a short period of anxiety until such time as the policy of the British and Allied Governments has been definitely announced. The advances of the past week have not been so pronounced as those of many preceding periods, all the same, the situation generally is in a very strong position. The cold weather is having a deterring effect upon coke production and the market is again facing a more or less serious shortage, with prices showing an upward tendency. Spot furnace on an advance of 50 cents is quoted at \$8.50, the contract price being \$5.00. A one dollar advance is also noted on contract foundry, the current price being \$7.50 per ton.

Despite the steady increase in production facilities the mills are still unable to cope with the heavy demand, and it is practically impossible to obtain billets or sheet bars for early delivery. Business in plates continues very heavy, many orders for cars having been recently placed. The shipbuilding interests are also heavy inquirers for plates, but delivery is very uncertain. Activities in the Canadian field is assuming large proportions and the requirements of shipping interests look like that it will continue to increase. The heavy demand for shell steel makes it impossible for the sheet mills to obtain their full requirements, and consequently mills are often required to close down for a short period until material is available. The Chicago price on black sheets has advanced \$5 per ton. Tin plate mills are booked six months in advance. The demand for wire and wire products continues very heavy, wire rods being hard to get as the mills are able to use most of their output for their own needs. The trade expects a further advance of \$3 or upwards at the beginning of the year. The wrought iron pipe and boiler tube situation is very active and price advances are expected in the near future. The local situation is unchanged, with the market awaiting the coming developments in the European situation.

**Metals**

All metals are showing a downward tendency, the activity shown being on the part of sellers, with buyers awaiting further developments. Copper is quiet and easier. Tin is irregular on lower quotations. Spelter has declined on poor demand. Lead is becoming easier. Antimony is firm.

**Copper.**—The attitude recently taken by the German Government has resulted in the market taking on a quiet tone, but owing to the evident scarcity of

## The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents

Montreal, Que., Dec. 11, 1916.—The chief thing occupying the attention of commercial and industrial interests at the moment, is the peace proposals of the Central Powers and the possible action to be taken by the Allied Governments. Markets are therefore more or less sensitive, awaiting developments. It is understood that the chairman of the Imperial Munitions Board, returned recently from England, bringing with him large orders for munitions, the placing of which will likely take place when the decision of the Imperial authorities regarding the peace proposals becomes known.

**Pig Iron**

The market in pig iron has had a quiet week, compared to the activity of the past month and a half, but the upward movement, while not so pronounced is still shown in the new quotations, the advances ranging from \$1 to \$3 per ton. The local situation is practically an unknown quantity as domestic quotations are for the present withdrawn; dealers here are however, quoting the nominal figure of \$40 per ton.

**Steel**

While the peace talk from abroad has created some uneasiness in the general

prompt metal, the price situation has been little affected. Producers are well sold for future positions, but the general feeling is one of anxiety, as a feature of recent transactions is that of customers reselling much of the metal lately purchased. An easier undertone is apparent, the British and New York quotations having declined. New York prices are now 34 cents for lake, 35 for electrolytic and 32 cents for castings. These prices are from 1 cent to 1½ cents easier than last week. Local conditions are unchanged with prices firm.

**Tin.**—The week has been somewhat irregular with the tendency in a downward direction. The present supply is however not in excess of demand, and, should peace negotiations fail, a return to former strength is anticipated. London and New York are easier, the latter having declined to 43 cents per pound. Dealers here report an easier undertone on a steady market, but prices are firm at 46 cents per pound.

**Spelter.**—In the absence of any important buying the market is dull and prices are lower. Production has lately been curtailed due to the reduction in smelter output caused by the cold weather; but this has not had the expected effect of strengthening the situation. However, this market like all others is meantime under nervous tension. A decline of one cent has put the nominal New York quotation at about 11½ cents per pound. The market here is quiet but dealers are still quoting last week's price of 14 cents per pound.

**Lead.**—This market in common with others is affected by conditions abroad, while the recent advance by producers is attracting few buyers, therefore a return to lower levels is shortly expected. The quotation of the independent producers shows a decline of ¼ cent, the price being 77½ cents. Prices here are firm, but with an easier tendency; quotation being 10 cents per pound.

**Antimony.**—The market is very quiet but prices are well maintained, dealers here still asking 15 cents per pound.

**Aluminum.**—The conditions are unchanged with prices firm at 70 cents per pound.

#### Machine Tools and Supplies

The market for machine tools is showing improvement, the demand for equipment having developed a slight increase. Activity is expected to become still further pronounced, as it expected that the Imperial Munitions Board will shortly place additional shell contracts, the filling of which will necessitate increased equipment or the replacement of machinery that has become inefficient owing to excessive wear.

Inquiry has been quite active for light tools both of standard and special make. Prices are well maintained owing to the cost of production. Labor continues to be a factor in curtailed production. The market in smaller supplies continues very active, with higher prices evident in many directions.

#### Scrap

Dealers report a higher tendency in heavy steel scraps and an easier tone in old coppers, but prices are unchanged on a fairly quiet market.

**Toronto, Ont., Dec. 19.**—While the German peace overtures have been the cause of much discussion in local business circles, it is generally felt that the proposals are more in the nature of a feeler than an exhibition of peaceful intentions. The proposals are purely tentative, and if rejected by the Allies will no doubt be proffered again with revisions in the terms. In any case, the proposals will naturally cause some uncertainty

#### CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion \$100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the Commission headquarters are at Ottawa.

more with regard to the future than at the present time, particularly with regard to making contracts in purchasing machinery or materials. Regardless of these proposals, and very properly so, the Imperial Munitions Board is making arrangements for the distribution of large orders for munitions. The Minister of Finance, in conjunction with the Canadian Bankers' Association, is making arrangements for further large credits on behalf of the British Government for the purchase of Munitions.

#### Steel

The peace proposals put forward by Germany and Austria have been the cause of considerable discussion in iron and steel circles during the week, but the feeling is prevalent that nothing will come of them at this juncture. The fact that the mills have practically twelve months' business on hand had a steady influence on the market, and the news did not cause as much excitement as might have been expected. There is, however, some uncertainty as to what may develop in this regard, and this will

probably check the strong upward movement in prices, which is certainly desirable. There is little doubt that prices have reached a dangerous level, forced up to some extent by the consumers themselves in their anxiety to get steel. There are no price changes of importance to note this week, and the market is firm. It is understood that Canadian interests contemplate purchasing large tonnages of shell steel in the United States for delivery any time during 1917. This indicates the sold-up condition of our mills. Canadian shipbuilding plants are seeking 20,000 tons of plates in the United States.

High prices continue to feature the market for black sheets, and a further advance on No. 28 gauge has been registered. A shortage of sheet bars and of coal has created a serious situation, and production has fallen off considerably. Manufacturers are also being handicapped by a shortage of cars, due to an embargo on the railways. The mills are advancing their prices, which will affect this market in due course. The market for galvanized sheets is unsettled, but it is doubtful if the recent decline in spelter will affect prices of sheets. Black sheets No. 28 are now quoted at \$5 per 100 lbs.

Prices of steel products in the United States have not as yet been affected by Germany's peace proposals, although if actual negotiations for peace are undertaken important developments may be looked for in the steel industry. The market continues strong, and further advances are looked for early in January. The present average of leading steel products is above \$70.55 a ton, which is about double the price of two years ago, at this time, for the same products. The demand for ship plates continues very heavy, and while buyers are showing every desire to pay the high prices, the sold-up condition of the leading makers alone prevents the acceptance of all the business that is being offered. There is a great shortage of billets and sheet bars, it being practically impossible to find semi-finished steel for sale at any price. An advance in wire products, probably \$2 to \$3 a ton, is expected before Jan. 1.

#### Pig Iron

The market continues very strong, and prices are still withdrawn. While the demand for foundry grades of pig iron is light, prices are very firm, as most furnaces are now producing basic iron for steel-making. Bessemer iron has advanced again, being now quoted at \$35.95 a ton, while standard low phosphorus is also higher at \$53 a ton, Philadelphia.

#### Scrap

The market is rather unsettled owing to the peace proposals, but it is by no means demoralized, and might easily develop strength with active buying. Prices

sagged during the week, but recovered to their former level. On account of the difficulty in obtaining billets, there is a particular demand for iron and steel car and locomotive axles and steel tires. Low phosphorus scrap is advancing on account of the heavy demand for special grades of steel made by the acid-open-hearth process and very tall prices have to be paid, as both Bessemer and low phosphorus pig iron are very high. There are no price changes to note.

### Machine Tools

The machine tool market has been less active during the week, due partly to the approach of the holiday season, and also to a meantime falling off in demand. Most munition plants are now well equipped, but others are either contemplated or under construction, and machinery will be required. Continued activity is looked for during 1917 unless the proposed peace negotiations assume some tangible form, which at present is problematical. Some machine tool builders in the Cleveland district have announced a further advance in prices effective January 1, due to the big increase in cost of labor and raw materials.

### Supplies

Business has been very brisk lately, notwithstanding the steady increase in prices affecting practically all lines of machine shop and mill supplies. Files have again advanced, those makes that were carrying a discount of 60 and 2½ per cent. are now 60 per cent. off list. Sandpaper has also advanced, the new discounts being for "B" and "A," 12½ per cent., and on "Diamond" and "Imperial" 20 per cent. off list. Pure Manila rope is up, being now quoted at 25½¢ per pound basis. Transmission rope and drilling cables are also higher, being quoted at 29½¢ and 27½¢ per lb. basis respectively. Canadian crude oil advanced 5¢ recently to \$1.95 per barrel. Gasoline has also advanced 1¢, and is now quoted at 27½¢ per gallon. Glue is also up in price and very scarce, English common sheet glue being quoted at 22¢ and French Medal at 25¢ per lb.

### Metals

German peace overtures have been the leading feature of the week in the metal markets. There was a reaction in London, but the markets in New York, although quieter, did not decline, with the exception of lead and spelter, which are weaker. Locally the situation is unchanged, and prices, with one exception—spelter, have been well maintained. The reason why the copper market did not break is no doubt due to the fact that there is no spot metal to be had, producers being sold up for several months. Tin is not, strictly speaking, a war metal, so would not be affected to the same extent as copper by peace talk. Spelter has declined, due to the unsettled

condition of the market, while antimony and aluminum are both unchanged.

**Copper.**—The market, although quieter, has not been influenced to any marked degree by the peace proposals, due to the fact that there is practically no metal for sale for earlier delivery than five or six months hence. There was a sharp decline in copper in London, but the market soon recovered. Local quotations are nominal, and are as follows:—Lake 38¢, electrolytic 38½¢, and castings 37½¢ per pound.

**Tin.**—The market is quiet and unchanged here, but lower in London. The peace proposals, although causing considerable interest in the trade, have not affected the situation to any great extent. It has been asserted by leading interests that a termination of the war would result in a sharp advance in tin. Local price, 47¢ per pound.

**Spelter.**—Prices have declined locally 1¢ per pound, the market being weak and demoralized on account of the peace proposals. There is also very little demand and no support to the market. Local quotation, 13½¢ per pound.

**Lead.**—Business is very quiet, and the market is dull and easy. Independent producers are not anxious to sell, and it is, therefore, difficult to buy metal. Local quotation unchanged at 9½¢ per pound.

**Antimony.**—The market is dull and demand light. Peace proposals have not affected the situation very much. Local price, 18¢ per pound.

**Aluminum.**—The market is quiet, but firm, due to the scarcity of ingot metal. Local quotation, 68¢ per pound.

### TRADE INQUIRIES

THE following inquiries relating to Canadian trade have been received by the Department of Trade and Commerce, Ottawa. The names of the firms making these inquiries, with their addresses available on application.

1860. Iron, Steel, etc.—A London firm who already represent an important Canadian manufacturing enterprise, seeks additional agencies in goods saleable in the United Kingdom, more particularly iron, steel and metals.

1861 Magnesite, chrome, graphite, kieselguhr, etc.—A London mineral firm wishes to get into direct touch with Canadian producers of magnesite, chrome, graphite, kieselguhr, and other refractory minerals and earths.

1868. Steel wire rods.—A Cardiff wire rope manufacturing firm wishes to obtain high carbon steel wire rods from Canada.

### FRANCE TO REACH OUT

NEXT summer, fifty young Frenchmen will be sent from France to the United

States and Canada to study American commercial methods in large banks, factories and shipping firms, and to become acquainted with the American mind and its principal viewpoints. They will stay a month in the United States, visiting in banks, factories and shipping offices at New York, universities and spinning mills in Boston, lumber mills and tanneries in Montreal, canning factories in Chicago, the seat of Government at Washington, iron and steel works at Pittsburgh, the petroleum industry at Philadelphia, grain stores at Baltimore, and "culture in general" at St. Louis. Meanwhile fifty young Americans will be doing exactly the same sort of thing in France with a view to getting ideas concerning French commercial methods and French points of view. It is hoped to establish, after the war, institutes in France and America which will supply all necessary commercial information, display specimens of goods, and in general promote reciprocal economic knowledge between the two countries.

### RUSSIA AND AGRICULTURAL IMPLEMENTS

ACCORDING to a report by the British Acting General Consul at Odessa, the Russian Minister of Agriculture, when introducing his departmental estimates in the Duma recently, stated that the lack of labor was making itself severely felt, and that the use of implements and machinery for agricultural purposes in Russia would have to be greatly extended. He referred to the fact that large orders would be placed in other countries, and urged the development of domestic facilities for the manufacture of the equipment required. The situation is summarized as follows:

Although there will evidently be an enormous shortage of agricultural machinery in Russia, it is thought that the prospects of large sales of British machinery are not very promising. Except in large threshing machinery, agricultural oil engines, and fodder-preparing machines, the British type of machinery is unsuited to Russian conditions. Russian manufacturers, with the assistance of the present subsidies and, probably, higher tariffs in the future, will be able rapidly to increase their output and satisfy the needs of the country to a very large extent, thus making it fairly independent of imported goods. Certain types of plows formerly imported are already manufactured in Russia in large quantities, and at an exhibition of agricultural machinery held at Moscow last year, remarkable progress was shown in the manufacture of all types of harvesting machinery. Many large works in Russia now producing war materials can readily be adapted for the manufacture of such heavy machinery as steam threshers, tractors, and oil engines.

## Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department of Trade and Commerce, Ottawa, is able to present the following list of the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

<b>BRAZIL</b> Bahia, British Consul. Rio de Janeiro, British Consul General. <b>CHILE</b> Valparaiso, British Consul General. <b>COLOMBIA</b> Bogota, British Consul General. <b>ECUADOR</b> Quito, British Consul General. Guayaquil, British Consul. <b>EGYPT</b> Alexandria, British Consul General. <b>FRANCE</b> Havre, British Consul General. Marseilles, British Consul General. <b>INDIA</b> Calcutta, Director General of Commercial Intelligence.	<b>ITALY</b> Genoa, British Consul General. Milan, British Consul. <b>MEXICO</b> Mexico, British Consul General. <b>NETHERLANDS</b> Amsterdam, British Consul. <b>PANAMA</b> Colon, British Consul. Panama, British Vice-Consul. <b>PERU</b> Lima, British Vice-Consul. <b>PORTUGAL</b> Lisbon, British Consul.	<b>RUSSIA</b> Moscow, British Consul General. Petrograd, British Consul. Vladivostok, British Consul. Odessa, British Consul General. <b>SPAIN</b> Barcelona, British Consul General. Madrid, British Consul. <b>SWEDEN</b> Stockholm, British Consul. <b>SWITZERLAND</b> Geneva, British Consul. <b>URUGUAY</b> Monte Video, British Vice-Consul. <b>VENEZUELA</b> Caracas, British Vice-Consul.
--	--	--

## Canadian Commercial Intelligence Service

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

### CANADIAN TRADE COMMISSIONERS.

<b>ARGENTINE REPUBLIC</b> H. R. Poussette, Reconquista, No. 46, Buenos Aires. Cable address, Canadian. <b>AUSTRALIA</b> D. H. Ross, Stock Exchange Building, Melbourne. # INDUSTRIAL <sup>A<sub>N</sub>D</sup> CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## Engineering

**Pembroke, Ont.**—The Pembroke Electric Light Co., propose building a hydro-electric power plant.

**Montreal, Que.**—Canadian Allis-Chalmers Ltd., will build a new forging plant at their Rockfield works near here.

**St. John, N.B.**—The Edward Partington Pulp & Paper Co., contemplate making extensions to their mill hours.

**Cobourg, Ont.**—It is understood that owing to prospects of increased business the Cobourg Steel Co., have under consideration the enlarging of their present plant.

**Vancouver, B.C.**—It is understood that a new steel plant will probably be established at Eburne, near here. W. H. McLaws president of the Alberta Rolling Mills at Medicine Hat, Alta., is interested in the scheme.

**Galt, Ont.**—Sheldons Ltd., are building an extension to their plant which will give them 6000 sq. ft., more floor space. The cost is estimated at \$18,000 and the contractors are P. H. Seccord & Sons, Brantford.

**Toronto, Ont.**—The Deyo Macey Engine Co., of Binghamton, N.Y., will move to Toronto on January 1. The company manufactures gas engines for farm and commercial use, and has received large war contracts.

**Tillsonburg, Ont.**—This town has secured a valuable addition to its industrial interests in a branch of the Huntley Manufacturing Co., of Silver Creek, N.Y., builders of cereal milling machinery and machinery for canning factories. It has purchased the property of the Tillsonburg Electric Car Co., and will begin immediately to put buildings in suitable condition.

**Fort William, Ont.**—Announcement was made on December 13 by officials of the Western Drydock & Shipbuilding Co. that contracts have been closed for the construction of eight steamers. Six of these will be ocean-going boats, and two will be 600-foot freighters for the Great Lakes. The capacity of the plant will be doubled. About 600 tons of steel has recently arrived, and work on two of the vessels will commence at once.

**Sarnia, Ont.**—The plant of the Canadian Woodworkers, in the northern

section of this city, has been sold to the H. Loughheed Machinery Co., who expect to have it in operation within a few weeks. The Woodworkers' plant was constructed three years ago, of concrete and steel, and is one of the most modern plants in the city, although it was never completed as a woodworking establishment.

**Montreal, Que.**—It is understood that important additions will be made to the Canadian Vickers plant here. The extensions will consist of two covered building berths, which, when completed, will double the ship-building accommodation already provided. At present the company has one large berth capable of taking a vessel 600 feet long. The dimensions of one of the new sheds will be 500 feet long and 128 feet wide, and the other will have a length of 400 feet and a width of 100 feet. The sheds will provide for the building of vessels up to approximately 12,000 tons. A commencement has already been made on this new work, which it is anticipated will be completed in March of next year.

## Municipal

**Lindsay, Ont.**—The Town Council are considering the installation of a sewage disposal plant.

**Owen Sound, Ont.**—The Town Council will submit a by-law in January to authorize the purchase of a motor fire truck at an approximate cost of \$6,500.

**Chatham, Ont.**—A by-law will be voted on by the ratepayers on Jan. 1, to authorize an expenditure of \$45,000 on extensions to the hydro-electric system.

**Hamilton, Ont.**—A by-law will be voted on by the ratepayers on Jan. 1, in connection with the proposed improvement to the waterworks system to cost \$362,500.

**Beaverton, Ont.**—On Jan. 1, a by-law will be voted on to provide for the extra cost of hydro-electric power supplied by the Hydro-Electric Commission. The cost will be \$5,000.

**Woolwich Township, Ont.**—The ratepayers of the Village of St. Jacobs will vote on a by-law on Jan. 1, to raise \$6,000 to pay for the cost of a hydro-electric plant.

**Welland, Ont.**—Town Solicitor J. F. Gross, acting under the instructions of

the Council, has given notice of application to the Legislature for a special act annexing to the town of Welland the large factory section in Crowland township bounded on the west by the Welland Canal and on the south by the Humberstone township line. The township is likely to strongly oppose the application. The annexation is proposed as a remedy for the prevalence of crime in this section, the township providing no police protection.

## General Industrial

**Guelph, Ont.**—The Dalyte Lamp Co., will build an addition to its factory to cost \$15,000. W. A. Mahoney, is architect.

**Toronto, Ont.**—A building permit has been issued to the Wm. Neilson Co., Gladstone Ave., for an extension to their factory to cost \$5,000.

**Toronto, Ont.**—The Canadian Carbon Co., has received a permit for the erection of a new factory on Paton road, to be 3-stories high and to cost \$23,500.

**Ottawa, Ont.**—The plant owned by J. H. Connor, manufacturer of washing machines, etc., was recently destroyed by fire with a loss of \$25,000. It will be rebuilt.

**Sarnia, Ont.**—The Brookfield Oil Co., composed of Sarnia and Oil Spring men, have bought another well on Dean Farm. This territory is in the township of Brooke, about eight miles east of Oil Springs, and is proving to be a good one. They have 10 producing wells and got last month about 100 barrels.

## Tenders

**Thorold, Ont.**—Tenders will be received by the undersigned until December 30, for the supply of a Turbine pump and electric motor. Specifications can be secured from the undersigned. L. S. O'Connor, Superintendent of Water Works, Thorold, Ont.

**Toronto, Ont.**—Tenders will be received, addressed to the chairman, Board of Control, City Hall, Toronto, up to January 16, for the installation of a 40 million Imperial gallon centrifugal sewage pump at the main sewage pumping station, Toronto. Specifications and forms of tender may be ob-

tained at the Works Department, Room 6, City Hall.

**Toronto, Ont.**—Tenders addressed to the Secretary-Treasurer of the Board of Education, will be received until Dec. 28, for enlargement of Orde St. School. Supplementary steam heating at Annette St. school. Fire doors, St. Clair Ave. school. Specifications may be seen and all information obtained at the office of the Superintendent of Buildings, Administration Building, Board of Education, College street. W. C. Wilkin-son, sec-treasurer, City Hall, Toronto.

**Ottawa, Ont.**—Tenders will be received up to January 15, for the construction of a reinforced concrete lighthouse tower and fog alarm building combined, and a wooden dwelling at Point Abino, township of Bertie, Welland County, in the Province of Ontario. Plans, specifications, form of contract and schedule of wages, can be seen, and forms of tender procured, at the Department of Marine, Ottawa; at the Harbor Master's Office, Toronto, and at the post offices, Welland, Port Colborne, St. Catharines, Bridgeburg, Hamilton and Brantford.

## Contracts Awarded

**Port Colborne, Ont.**—Contract for turbines and generators required for the new plant being erected by the International Nickel Co., has been awarded to the Ridgeway Engine & Dynamo Co., New York.

**Chatham, Ont.**—The Chatham Paving & Construction Co. has been awarded the contract for the erection of a cooling station for the C.P.R. to be built near the bridge where the C.P.R. crosses the river. The same company has the contract for the remodeling and building of an addition to the Hayes Wheel Co. factory.

## Trade Gossip

**The Dominion Copper Products Co.**, of Montreal has increased the capital stock of the concern to \$3,500,000.

**Montreal Machinery & Supplies, Ltd.**, have been appointed sole agents in Canada for the Alston Saw & Steel Co., Folcroft, Pa.

**Montreal Machinery & Supplies, Ltd.**, have been appointed Canadian agents for the Rich Tool Co., Chicago, the particular specialties being high-speed drills, reamers, and rivet sets.

**Crude Oil Advances.**—Crude oil from Canadian fields took another jump at

Sarnia on Dec. 13, when the Imperial Oil Co. announced a raise to \$1.95 per barrel, an advance of five cents.

**The Foundry & Machine Co., Montreal**, have bought out the Federal Brass Foundry Co. and are putting up a brick addition to the plant which will be 45 feet square and two storeys high.

**Pig Iron Production.**—New Zealand authorities are studying the possibility of producing pig iron on a large scale by electricity, as much ore and ample water power are available.

**R. E. T. Pringle Ltd.**, Toronto manufacturers agents, have opened a sales office at 302 Donald Block, Winnipeg, Man., with F. E. Filer in charge; also at 3402 Osler Ave., Vancouver, in charge of Fred Fletcher.

**The Turbine Equipment Co.**, Toronto, have been awarded a contract for centrifugal sewage pumps for the Town of New Toronto, Ont., amounting to \$4,250. Two of these will be driven by vertical motors, and the other will be direct connected to a high speed gasoline engine.

**Copper in Quebec.**—During the past year development work has been taking place on a copper discovery at Newport, County Gaspe, Quebec. Experts, having recommended further development, the properties will be taken over by American interests. High grade ore has been obtained, assays showing as high as 57 per cent. copper.

**The E. B. Plewes Co.**, Winnipeg, has been incorporated as a limited liability company, and is now known as Plewes, Ltd. They are manufacturers' agents, and carry large stocks of hardware and machinery supplies. Their offices and warehouses have been moved from 120 Lombard Street, to 197-199 Princess Street.

**The Steel Company of Canada** held their Annual Convention at the Royal Connaught Hotel, Hamilton on Dec. 12-13-14, being attended by Company's representatives from all parts of the country. A feature of the convention was a number of interesting papers by various members of the staff and officials.

**Advice to Importers.**—The Department of Trade and Commerce strongly advises Canadian houses wishing to import by license articles on the British list of prohibited exports to first communicate with them, giving by affidavit the purpose for which the material is required and through whom it is bought. In this way much time will be saved.

**Little Opposition to Power Union.**—The plan of the Ontario Power Union to

secure from all the municipalities in the Niagara system on the first of the year a verdict upon municipal ownership of Chippewa Creek power development at Niagara Falls, is making excellent progress. According to T. J. Hannigan, secretary of the Union, practically every municipality will vote on the matter.

**Canada's Grain Acreage.**—A statement issued on December 15 by the Census Bureau gives the results of a grain acreage census taken last summer in the three prairie provinces. As indicating the increase in crop producing areas, it is shown that the total acreage under wheat, barley, oats, rye and flax grew from 8,040,981 in 1906 to 17,100,487 in 1911, and 22,814,591 in 1916. There was thus a gain of 5,714,114 acres, as compared with 1911, and 14,773,610 as compared with 1906.

**Toronto, Ont.**—Five new munition factories will be opened here shortly after the beginning of 1917. One of these factories has a waiting list of 700 women and there are 1,000 more registered at the employment bureau at 164 Bay street. Some of these, however, will not be able to pass the tests required for the arduous work which they would be called upon to do. Dissatisfaction is being expressed at the small wage paid to women inspectors who, at the start, are paid only 15 cents an hour, although later they work up to 18 cents an hour.

**Requisition Ships When Required.**—An Order-in-Council has been passed at Ottawa providing for the requisitioning of British ships, registered in Canada when required by the Government for the carriage of foodstuffs and other articles of commerce. Such requisitioning is to take effect upon notice of requisition being served by the Minister of Marine on the owner of any ship. Similar provisions were adopted some time ago in Great Britain. The Order-in-Council contains provisions as to whom notice of requisition is to be given and who may, under the authority given him by the Minister of Marine, gave it.

**Molybdenite Mining in Quebec.**—Within thirty-five miles from Ottawa, at a distance of two miles from the railway station of Quyon, Que., a deposit of molybdenite has been developed by the Canadian-Wood Molybdenite Co. The first shipment of ore was made in April, and since July 1, the shipments have averaged 250 tons a week of ore containing about 21½ per cent. molybdenite, which for the three months ending September 30, will total approximately 75 tons of molybdenite. The ore is now being concentrated partly in Ottawa and partly in Denver, Color-

ado. The product is being shipped to London and to France. A concentrating mill is being put up near the mine.

**Ore Shipping Season Broke All Records.**—The ore shipping season at Cleveland, Ohio, closed with a record for every month from April to December, and with a total movement that was much bigger than expected and which broke all records. August was the banner month of the season when the shipments were 9,350,140 tons. During the twelve days the docks operated during December, the fleet loaded 1,085,900 tons, which was more than double the record for shipments for December, made in 1909, when the mines sent for-

ward 519,525 tons. The total movement for 1916 was 64,734,198 tons, which is more than 4,000,000 tons greater than the high mark named for shipments early in the season. Conditions generally were favorable for ore men, and the wonderful showing made by the fleet was due very largely to good weather, a marked increase in the stage of water, and wonderful despatch also added materially to the capacity of the fleet.

## Personal

**L. V. de Bury**, formerly president of the B. & S. H. Thompson Co., Montreal has been appointed general sales agent

at Montreal of the Dominion Steel Corporation.

**L. B. Beale**, of Toronto, British Columbia lumber commissioner for Eastern Canada, has returned after nine weeks' absence, during which time he visited practically every lumber mill in the province of British Columbia in the interests of his department.

**P. V. G. Mitchell**, manager of the White Star-Dominion Line, Montreal, has been appointed an honorary lieutenant-colonel. The appointment comes as a reward for Mr. Mitchell's services in connection with the transport of Canadian troops and supplies overseas.

**George S. Rice**, chief engineer of the United States Bureau of Mines, Washington, D.C., has been engaged by the Provincial Government of British Columbia to make an investigation of the Coal Creek coal areas of the Crow's Nest Pass Coal Co., near Fernie, B.C.

**Dr. A. B. Macallum**, the new head of the Scientific and Industrial Committee, has tendered his resignation to the University of Toronto. The matter has only been discussed informally in University circles, but it is understood that Dr. Macallum will not sever his relationship immediately.

**D. M. Medcalf**, chief inspector of boilers for the Province of Ontario, has returned from New York and Washington, D.C., where he attended meetings called for the purpose of discussing the proposed A.S.M.E. code of boiler rules and regulations. The meeting in Washington was called by the Industrial Commission of Ohio, and the New York meeting by the American Society of Mechanical Engineers.

**Fred W. Evans**, who has been acting manager of the Canadian Fairbanks-Morse Co's., Toronto office, 26-28 Front street, for the past year has been appointed manager of that office. Mr. Evans has been with the company a number of years, having been associated principally with the machine tool end of the business. He was manager of that department before being appointed acting manager of the Toronto sales office.

**W. R. Baker, C.V.O.**, secretary to the C.P.R. and assistant to the president, has, at his own request, been relieved from his duties and placed on the retired list. **E. Alexander**, formerly assistant secretary to the company, succeeds Mr. Baker. Mr. Baker's association with the company dates from its inception in 1881. From 1883 to 1900 he was general manager of the Manitoba and North-West, but joined the C.P.R. when that road was acquired by the big railway.

## 3 BIG REASONS WHY YOU NEED

# PURO

(MADE IN CANADA)

1. Puro Sanitary Drinking Fountains will give you a better water supply cheaper.
2. Puro will cut your water bills 15% to 35%.
3. PURO will safeguard the health of your employees and raise the standard of efficiency.

Are not these reasons enough? Then why hesitate longer? PURO equipment is not expensive—the first cost is low and the up-keep nothing. Easily attached; positively fool-proof. Let us make you a special proposition for a try-out in one of your departments. Write us now—to-day—giving us the number of men; an inquiry will cost you nothing.

## "For Increased Production"

Illustration below shows the "Bridgeford" 27" heavy duty Lathe arranged for rough-turning 8", 9.2" or 12" shells. Power is transmitted through 8" driving belt, with three instantaneous speed changes through hardened steel gearing. Main driving gear 6½" face. Four instantaneous feed changes—all through cut steel gearing, running in oil. Leading shell manufacturers have from 70 to 200 of these machines in operation—giving remarkably satisfactory results.

WE can make early deliveries. Write us.

## Boring Lathe for 8", 9.2" and Larger Shells

Marvellous for strength, accuracy and production.

A machine of the heavy, low-swing type, having specially designed carriage with auxiliary hand feed for internal profile.

Carries a 5½" steel bar with male taper, allowing for light design of cutter heads; three speed changes—automobile style. All speed gearing is steel, hardened, running in oil bath.

Regular equipment includes water attachment, pump, pan and piping, pot chuck, boring bar and steady rest—everything except cutter heads.

STEWART NO. 1 OVEN

STEWART NO. 28 OVEN

## Stewart No. 10 Cyanide Furnace

Equipment using cyanide of potassium is used extensively by bank note engravers, makers of engraved plates and transfer rolls, cutters, dies, springs, chains, and numerous other steel parts requiring hard surfaces without great depth of case. A furnace of this sort may be used for heating other chemical solutions whose fumes are poisonous and injurious to the workmen, as the hood is connected with an outside flue.

## Specifications

Capacity, 10 in. deep, 8½ in. diameter (inside measurement).  
Weight, crated for shipment, 600 lbs.  
Gas consumption, about 175 cubic ft. per hour.  
Gas and air supply, 1 in.

Price, with blower, \$139.70.  
Price, without blower, \$91.30.

STEWART NO. 10 CYANIDE FURNACE

## Stewart No. 3 Forge

## Specifications

Size of front opening, 3½ in. x 8 in.  
Size of rear opening, 3½ in. diameter.  
(Rear opening same as front, if specified.)  
Depth of heating space, 10 in.  
Gas consumption, about 80 cubic ft. per hour.  
Gas and air supply pipe, 1 in.  
Net weight, 385 lbs.  
Shipping weight, 490 lbs.

Price, with blower, 79.75  
Price, without blower, 49.50

ROD END FORGE

## Rod End Forge

For light forging and tool dressing—file makers—knife or razor blades—rod or pipe end heating, etc.

## Specifications

Size of opening, 2 in. high, 10 in. wide, giving a spot heat of 8 in.  
Gas consumption, about 70 cubic ft. per hour.  
Net weight, 400 lbs. Shipping weight, 450 lbs.  
Gas and air connections, 1 in.

Price, with blower, \$79.75.  
Price, without blower, \$49.50.

Burners arranged in two sections so heat is delivered for half lengths, if desired. Heats for bending, forming, etc.

SPECIAL FORGE

## Special Case Hardening and Annealing Furnace—Built-in

Furnaces of such proportions are too heavy to ship assembled. By being erected on the job the walls may be built heavier, cutting down loss of heat by radiation.

## Specifications

Size of opening and heating space,	Thickness of walls, 9 in.
12 in. x 24 in.; 60 in. deep.	Size of gas connection, 1½ in.
Height from floor, 30 in.	Size of air connection, 1½ in.
Floor space, 54 x 82 in.	Gas consumption, about 600 cubic ft. per hour.

Price on this and other sizes on application.

STEWART SPECIAL CASE HARDENING FURNACE

Chicago Flexible Shaft Company

Chicago, Ill.

# STEWART FURNACES

STEWART SPECIAL COMBINATION FURNACE

## Stewart Triple Purpose Furnace

(For Natural or Manufactured Gas)

Any section is capable of High Speed Steel heats. In the right-hand unit a direct heat is delivered, and the heat may be made so intense that a steel rod  $\frac{1}{8}$ -inch diameter may be melted in ten minutes—from a cold start. The opening is 2 inches x 4 inches, and gives a spot heat 8 inches long. May also be used for tool dressing, bending, forging, etc.

The center section is an oven with an opening 4 inches x 8 inches, and 12 inches deep. The linings are of molded fire-clay and silica, 3 inches thick, a special mixture determined in our laboratories for heat-retaining properties. Fitted with a "U"-shaped bottom slab—giving all the advantages of an open oven, and none of the disadvantages of a muffle. 2,250 degrees Fahrenheit may be reached in 25 minutes and held indefinitely.

The section at the left is our regular No. 12 Barium Chloride Furnace, fitted with a standard graphite crucible, of the same number, for handling high speed steel by the Barium Chloride process.

Price, complete, with No. 3 blower, \$167.75  
Price, complete, without blower, 137.50

STEWART NO. 25 OVEN

## Stewart Special Combination Furnace

(Not intended for High Speed Steel)

Consists of an oven furnace, crucible and forge, all combined on one base, for economy and convenience. The forge is provided with an opening at the rear, permitting the heating of long bars, and the oven section may be transformed into a muffle furnace by removing the slab and inserting the muffle.

### Specifications

Opening of muffle section, 4 in. high in center,  $7\frac{1}{2}$  in. wide,  $13\frac{1}{4}$  in. deep.  
Forge section, 4 in. high x  $5\frac{1}{4}$  in. wide x  $10\frac{1}{4}$  in. deep.  
Crucible, pressed steel, diameter at top, 6 in., depth, 12 in.  
Size of gas supply pipe,  $1\frac{1}{4}$  in.  
Size of air supply pipe,  $1\frac{1}{4}$  in.

# L-XX High Speed Steel

**A**S a medium between you and increased production, L-XX High-Speed Steel would prove excellent. In strength and lasting power it is unequalled. As a cutting tool it is the "missing link" you have been looking for so long. If you knew the extra care and watchfulness exercised in making you would not wonder at the sterling quality of the finished product.

## Deward Non-Shrinking Tool Steel.

With this metal you don't have to "allow" for shrinkage or waste time "figuring" how your job will be finished. Don't leave anything to chance. **Know** where you are at. Deward Non-Shrinking Tool Steel will do it.

## E-B. Alloy. Ideal for Hot Work.

You find difficulty when working on hot material with ordinary tool steel? Our E-B Alloy was made especially for this work. Heat in no way affects its power or efficiency. This should prove invaluable to you.

## Atlas XX Carbon Steel

When we say that genuine Swedish Iron is the foundation for the steel you will at once realize its great value—if it is made right. Our experience in producing tool steel is international. Our products are recognized for their high quality. In this **ATLAS XX CARBON STEEL** we have put the same amount of care and knowledge as in our other products, and we say that for a straight carbon tool steel this is super-fine.

Manufactured by

# Atlas Crucible Steel Co.

# STEEL PLATE WORK

*Oil Storage Tanks, Pressure Tanks, Smoke Stacks,  
Riveted Steel Pipe, Penstocks, Bins and Hoppers*

## PREPAREDNESS

PLATE mills are congested with orders, and the insistent demand of our customers is "How Soon Can You Ship?"

To users of tanks, or steel plate work of any description, who are not aware of the service given by this Company, we emphasize these points:

90% of all inquiries received during the past year were shipped from stock, or material in transit.

We will start 1917 with a larger stock of plate than any time during the past twelve months, and shipments at regular intervals are scheduled for months to come.

This service has helped hundreds of firms throughout Canada through a very difficult and trying period and can be depended upon throughout 1917.

We have the material—the organization and the facilities to meet your requirements.

If service and quality are a consideration—send us your inquiries.

# *A Tool Metal Beyond Competition*

**NOT A STEEL**

A remarkably hard and tough alloy. Not a particle of iron in it.

Tools made of Stellite stand up to speeds and feeds far in excess of that of the very best high speed tool steels.

Stellite tools have no temper. They cut as well when red hot as when cold.

**With "Stellite" Tools you can increase the speed and production of practically every lathe in your plant from 20% to 300%.**

There's nothing like trying for convincing.

Why not make the test now?

# Giant Quality—

The quality of **ATLAS METALS** has been repeatedly endorsed by the British Government in all departments, also by many foreign governments. All the Allies have purchased Anti-Friction Metal from us during the war. Our products are the choice of "those who know," due to the fact that being smelters and refiners, as well as White Metal Manufacturers, we are able to guarantee that only highly refined materials are employed when alloying our brands.

For 17 years the Atlas Mark has stood for supreme quality.

## In Steamship Engine Work

we have the full confidence of a large proportion of the Superintendent Engineers of the leading British steamship lines. For work of this class our Tenaxas Al Plastic Metal is recognized as the highest possible quality, also our W.E. Watson Marine Bearing Metal.

## For Bearings of High Speed Engines

where a specially tough mixture of Anti-friction Metal is necessary, there is no superior metal to our Amacol White Bronze. Enormous quantities have to be supplied for this purpose.

## For Motor Car Engines

our Tenaxas and Durastic Copper Hardened Metals are the recognized standard of perfection, both for light cars and heavy commercial vehicles.

## For General Engineering

our Atlas, Mascot and Babbitt Alloy are known and recognized the world over for their consistently good service and reliability.

The following list offers a comprehensive range of accurately alloyed brands from which selection can be made for any given purpose where high-speed metals and alloys of the finest possible quality are required:

- Atlas Metal, W. E. Watson's Brand
- Atlas Metal, M. B. Tin, Toughened
- Amacol White Bronzed
- Tenaxas Al Plastic Metal
- Durastic Copper Hardened Metal
- W. E. Watson's Marine Bearing Metal
- Mascot Metal
- Babbitt Metal, W. E. Watson's Brand

# Nova Scotia Steel & Coal Company

*Limited*

New Glasgow, Nova Scotia, Canada

4,000 TON STEAM HYDRAULIC FORGING PRESS FOR MARINE AND OTHER HEAVY FORGINGS.

The product of a modern steam-hydraulic press is denser and more homogeneous than can be obtained with the steam hammer, due to the effect of the blow of the latter not penetrating to the centre, in contradistinction to the uniform kneading effect of the press; while the amount of work that can be done by the latter at one time with little variation in temperature, strongly tends towards a better product. The greater uniformity and reliability of steam hydraulic forgings make their use imperative wherever high-class products are required.

# Cut Your Cost In Two—Save A Man

## *Two Shells Instead of One, With One Operator*

4", 5" and 6" Rough Turning Lathe.

**T**HIS machine is the result of many experiments, covering a period of over a year and is now at the producing stage.

Machine will turn out double the number of rough-turned shells in a given time than any other single lathe of its size.

Features such as the following should interest manufacturers who desire to increase their output without increasing their costs.

This lathe will do it and do it continually, 120—4.5 Shells rough-turned in 10 hours.

Time required for chucking and replacing shells, 35 seconds.

Lathes fitted with two positive drive chucks. Six feet of floor space saved, easy to operate, costs less than two other lathes. Increased output and decreased overhead. Made in sizes for 4.5" and 6" shells.

## Dominion Universal Grinder

**Always Appreciated by the Best Tool Makers**

**BECAUSE** of its sterling worth, universality and solidity commends itself to all alike. It not only adapts itself to the most delicate and precise operations, but it lends itself to heavy surface grinding. If you want to know—

## This New 15-inch Shaper

Is the result of a long-felt demand for this kind of machine.

### OUTSTANDING FEATURES:

The column is heavy and strong, well braced and ribbed.

The cross-rail and table are of proper proportions with large bearing surface, shown in cut.

All bearings and sliding surfaces are hand scraped to surface plates and are fitted with adjustments for taking up wear.

All feeds have graduated collars.

Changes of feed and position of ram are made from working side.

*We'll be pleased to quote you prices and furnish any information required.*

## "McKenzie" Engine Lathe

### The Standard of Accuracy

You will not find anywhere a lathe of this type and capacity that is better worth its price or that will give you more complete satisfaction in actual work. It is made in an improved design from new patterns, and in every detail of its construction and material it is flawless—a machine you'd be glad to own.

# Cataract Precision Bench Lathes and Attachments

Are doing Remarkable Work in a Number of Canadian Factories Where Their Splendid Qualities are Proved and Appreciated

Coming down to facts, what do you think of this machine?

What do you think of the base, the circular bed, the sliding tool post, the strength suggested in that massive headstock, the range of gears, the special tailstock, and the arrangement of those gears? We think you will do as a great many other Canadian firms have done, write for our

catalogue which gives the specifications, descriptions, etc.

"Write now."

## If You are in the Market for 100% Efficiency Lathes

### Write Us

Efficiency is synonymous with the name of Hardinge. The pioneering days, spent in experimenting, have resulted in the finished

product and right proud we are of it, too. Its quality is of the best, its price is most reasonable, its efficiency is beyond expectations. Do you know of any equipment with a Hardinge Lathe? What do they think of

it? When you find out write for our Catalogue, which will give you a complete line on our products. Get in touch with us.

Catalog No. 15 is ready to mail to-day. You should write "right" now.

## Hardinge Bros.

1770 Berteau Ave., Chicago, Ill., U.S.A.

Mention this paper when writing advertisers. It will identify the proposition about which you require information.

# Read the Descriptions—Study the Illustrations

**Then Consult Us--  
We will Co-oper-  
ate with you.**

To us that would be an ideal situation—co-operating with you. We can give you such service that our co-operation would help us both.

## The Cataract Quick Change Precision Lathe

Length of Bed ..... 52"  
Total Length of Lathe ..... 65"  
Distance Between Centres .... 28"  
Swing ..... 9" and 15"  
Swing over Carriage .5½" and 11½"  
Diameter of Lead Screw .1" x 6 pitch  
Diameter of Front Cover.... 2 1-32"  
1 Diameter of Rear Bearing.... 1 1/8"  
Length of Spindle ..... 15"  
Hole through spindle ..... 1 1/4"  
Draw-in Chuck Cap.... 1" maximum

From the above specifications you will observe that it is ideally designed for ordinary or specially fine work. Study the illustration and then write us for further information.

## Cataract Tool Post Lathe

An ideal machine for fine work. Especially adapted for optical work or any series of work where operations such as turning, boring and recessing, also internal and external threading, must be done in one setting.

Six tools in turret independently adjustable.

Additional tailstock, turret or other standard attachments allowable.

Will take round stock ½", ¾", 1", 1 1/8" and 1 1/2-16". In ordering kindly mention chuck capacity desired.

One horse-power required. Supplied with or without motor drive.

*Catalogue No. 15 is ready to mail to you to-day. Write for it to day.*

## It Isn't What You Do—It's How You Do It

Any lathe will do your work, but **how** will it do it? That is the basis of the Himoff Machines.

**How** to do your work. They have "Herculean" strength. They have variety. (90% of your work may be performed on the upper lathe). It is not encumbered by false motion or excessive attachments.

Study the upper illustration. This

lathe is built in one size, 21" swing. It is a manufacturing lathe built to handle every straight or taper-turning operation.

The lower illustration is the Hercules Turret Lathe and Screw Machine. Built in three sizes,  $\frac{5}{8}$ ", 1" and  $1\frac{1}{2}$ " automatic chuck capacity. Detailed specifications on request.

# **“STERLING” HACK SAW BLADES**

These heavy duty blades are made particularly for the No. 5 **“STERLING”** Heavy Duty Power Hack Saw Machines. They are of very coarse pitch, manufactured from best material made by any mill, mechanical construction being correct, and by a special heat treatment the back of this blade is of a hardness which minimizes the danger of breakage.

The teeth being left extremely hard and tough warrants the maximum amount of cutting. These blades not only will, but actually are, doing really wonderful work on high carbon and manganese steel from three to six and eight inches in diameter. This, the last word in a hack saw blade, is manufactured by

Write us for prices on our Special Hammer Attachment for nosing 6-inch Shells. It will save you money.

# THE IDEAL DIE

## SELF-OPENING ADJUSTABLE

With Simplicity for Continuous Threading

### "IDEAL" ACCURACY

Ideal Self-Opening Dies are big time-savers. This is the prompt verdict of all IDEAL users; but aside from that, they have an advantage of extreme importance, positive accuracy, only six loose working parts — with every wearing surface specially hardened — that's the reason

why the IDEAL cuts clean, accurate threads at high speed throughout its long life. Moreover, the opening of the die is positive, utilizing the belt power or cutting strain with no dependence on a spring.

For big economy in your turret lathe and screw machine threading jobs, use the "IDEAL," a fitting name for this die head. We named it that because of its mechanically perfect design. Users call it that because of its practically perfect results.

### IDEAL ALL-WAYS

Send prints or samples of work and we shall be pleased to give full information regarding your requirements.

No. 2-A Universal Hollow-Hexagon Turret Lathe with Bar Equipment.

Bar Stock,  $2\frac{1}{2}$ " x 29".  
Swing-over Bed,  $16\frac{1}{2}$ ".  
Swing-over Carriage,  $13\frac{1}{4}$ ".

No. 4 Universal Turret Screw Machine with Bar Equipment.

Bar Stock,  $1\frac{1}{2}$ " x 10".  
Swing-over Bed, 16".  
Swing-over Carriage,  $8\frac{1}{2}$ ".

## Two Cuts at One Time

WITH each of these machines you can face or undercut or form with the square turret while boring or turning with the hexagon turret. This ability to take two cuts at one time is provided by the separate feed shafts for the carriage and turret, each with a wide range of feeds. It means increased production — increased profit — without sacrificing accuracy.

These machines are strong and rigid, the head and bed being cast in one piece; tools are rigidly supported in the direct line of thrust and torsional strains; and there is ample provision for taking up wear after years of hard service.

Each, in its class, gives maximum efficiency in the rapid and accurate production of duplicate pieces; yet changes from one job to another are made so quickly that even a small number of duplicate pieces can be turned out profitably.

*Ask for Descriptive Literature.*

# Sturtevant

(Trade mark)

## Power Apparatus

Years ago we developed an engine in order to supply suitable prime movers for our fans. This was perfected and improved. Then a complete line was designed and this proved so successful that Sturtevant engines are to-day used universally wherever high grade machines are required. Since the original development more than 40 years ago we have broadened our field of manufacture. Other lines have been added one by one until the complete list of Sturtevant Power Apparatus now includes:

Engines  
Turbines  
Motors  
Generating Sets  
Turbo-Pumps  
Fuel Economizers  
Mechanical Draft Apparatus  
Turbo-Undergrate Blowers  
Mechanical Stokers

Our Power Apparatus Bulletin illustrates all of these lines and we have a copy for you. Ask for bulletin 213-U or for General Catalog No. 195-U.

# POWER EQUIPMENT

**CONTINUITY OF OPERATION** is the first consideration of every plant owner and can only be secured by the installation of the most dependable Engines and Boilers. Over sixty years of experience in the manufacture of High Grade Power Equipment has secured for us the confidence of thousands of Canadian Manufacturers in whose plants G. & McC. Engines and Boilers are in operation.

## WE BUILD

Steam Engines, Turbines, Return Tubular and Water Tube Boiler, Heaters, Pumps, Transmission Machinery, etc.

G. & McC. Co. Engines and Boilers have been designed

with the object in view of providing Manufacturers with equipment that will produce a **CONTINUOUS SERVICE** with a minimum cost for Maintenance. Our Engineering Staff is constantly on the alert in their efforts to improve and increase the efficiency and economy of our output.

The Advice of our Engineering Department, Catalogs, Specifications, Etc., are Yours for the Asking.

After severe and thorough tests Keith fans have been adopted by the British Admiralty for ventilating and forced draft purposes for its fighting ships. United States and other naval powers also use Keith fans. Why? Because they are the most efficient and most rigidly built fan that can be obtained.

The blades are so shaped and formed as to admit of the handling of the largest volumes of air at uniform pressure over the entire width of the fan wheel.

Superior workmanship and material form the foundation of our success.

# BELTING

**Y**OU have the best when Sadler & Haworth Belting feeds the power to your plant, and there is a Sadler & Haworth Belt for use under every condition. A complete stock of the following is carried at our factories and warehouses:

Leather Belting	Hydraulic Leather
Rubber Belting	Mechanical Leather
Cotton Belting	of all kinds
Canvas Belting	Leather Fillet
Hair Belting	Loom Straps
Balata Belting	Harness Straps
Lace Leather	Loom Pickers
Belt Leather	Belt Cement
Valve Leather	Belt Dressing
Washer Leather	Belt Fasteners
	of all kinds

We will be glad to furnish information and prices on any of the above.

A copy of "The Great Amphibian" by Rt. Hon. Winston Churchill, will be sent to you on request to our Montreal office.

*The Belt  
with the  
Grip—*

# "Lincona"

## BALATA BELTING

*Manufactured by*

**JAMES DAWSON & SON, LIMITED**  
Lincoln, England

Lincon Balata Belting will pick up a load suddenly better than any other type of belting. The tensile strength is almost double that of a leather belting. Lincona Balata Belting improves with age. It stretches less and runs straighter than any other type of belting. It can be exposed to snow, rain and every condition of weather without injury. It can be run in water without trouble.

"Lincona" Balata Belting is used on many drives so difficult that they defy every other type of belting. •

It is the strongest Balata Belting made.

The secret of the greater strength of "LINCONA" Balata Belting is in making the Balata a fluid which will saturate the duck, instead of a paste placed on and rolled in. The fluid Balata used in the "LINCONA" process also allows the duck to be compressed more closely, so producing a belt thinner for the number of plies. This gives a stronger wearing surface to the pulley and less friction.

"Lincona" Grip will give you a maximum transmission of power. Write us about your specific needs.

## DEFIES THE RAVAGES OF TIME

HAS BEEN RUNNING DAY AND NIGHT FOR FIFTEEN YEARS  
WITHOUT APPRECIABLE WEAR

THE CITIZENS ELECTRIC CO., LTD.

Magnolia Metal Company,

Smith Falls, Lanark Co., Ont.,  
July 16, 1916.

Gentlemen:

We are in receipt of your favor of the 11th inst., enclosing copy of the letter of our Engineer (Mr. Seroggie) dated January 29th, 1911, re our line of shafting which, up to that time, had been running day and night ever since under the same conditions and the years do not seem to have any effect on it whatever—about the only thing around here which escapes the ravages of time.

You are at liberty to use this letter if you so desire.

Yours truly,

THE CITIZENS ELECTRIC CO., LTD.  
Jas. S. Gould.

### PRACTICAL ENGINEER POCKET BOOK:

## Hoyt's Frost King

This babbitt has been tested for years in many of the large machinery manufacturing plants, and has proven such a success we are placing it on the market as a first-class, all-round Babbitt. It will not only take care of high speed, but will stand up to heavy duty work in an extraordinary way.

For saw mills, planing mills, threshing engines, traction engines, rolling mills, pulp machinery, and all classes of stationary engines, it is without equal.

## Hoyt's Genuine "A"

The Babbitt is a pure tin, copper, anti-mony alloy, free from lead. It is made on the original Babbitt formula, and for high-grade, Genuine Babbitt stands in a class by itself.

# Hoyt Babbitt Metals

*Lighten the Babbitt Expense of the Plant*

For nearly 40 years we have devoted our efforts exclusively to the perfection of white metal alloys, having delved carefully into the chemical, physical and mechanical properties of each element and its various compounds.

All elements entering into our mixtures are carefully refined and put together in such proportions and in such relation to each other that the best possible alloy is secured for the work for which it is designed.

**ANNUAL SALES OVER  
5,000,000 DOLLARS**

## Hoyt's Nickel Genuine

Owing to the greater service required of Babbitt, as modern machinery developed, it was necessary for us to design an alloy that would meet with these new requirements. Our Nickel Genuine, for heavy duty, high-speed work, is probably as perfect as an alloy can be made. It is especially designed for use in gas engines, gasoline engines, and all classes of marine engines, and is especially adapted for automobile engines.

This alloy is exceedingly tough and durable.

## Hoyt's Dynamo Genuine

As the name implies, this metal is compounded especially for dynamo and motor work. It is the only alloy that will give the best service on street car motor or any motor that runs under severe duty. It is an extremely high Copper alloy, and is as pure an actual Bronze as a Babbitt can be made with success.

# PULLEYS

No Keys

No Set Screws

In Perfect Balance

Lighter

Stronger

Better Belt Surface

## The Dodge Standard Wood Split Pulley

The Wood Split Pulley is better than either cast iron split pulleys or steel split pulleys for the following reasons—

The wood pulley is lighter, stronger, better balanced, and provides a very much better belt surface. It costs 33 1-3% less money and provides 50% more returns in horse-power value. It may be run at very much higher speeds with no danger of bursting—also it may be had quicker and in a greater range of sizes.

It costs less to get—less to put on—and less to keep.

We make approximately 300 Dodge pulleys every day—everybody uses them.

There are more Dodge pulleys making ammunition than any other kind—you can get them quick.

Every pulley is thoroughly nailed. Every pulley is guaranteed for Double Belts.

We are Canada's greatest pulley makers.

*If you have not our Books, write us.*

## DODGE MANUFACTURING COMPANY

Toronto - - - Montreal

# Anaconda

## 1800 Feet Belting 2½" 4 Ply

This is the belt you should be using if you want the largest delivery of power and maximum belt service in driving machines, such as Saws, Turret Lathes, Heavy Duty Drills, Grinders, etc., that use liquid cutting compositions, because it is filled with a composition that makes it heat, oil, water and acid proof.

The saws, as illustrated above, are all "Draw-cut," which means that the strain on the belt is intermittent and if the belts slipped satisfactory work could not be done. Anaconda Belting possesses unusual wearing qualities, and reduces power loss, repairs, "take-ups" and attention to the minimum. It is of greater general serviceability than any other belt. A trial will convince you.

*The initial cost is 50 per cent. less than leather.*

**MAIN BELTING COMPANY OF CANADA**

32 Front St. W., Toronto

LIMITED

10½ St. Peter St., Montreal

*Mention this paper when writing advertisers. It will identify the proposition about which you require information.*

# Leviathan Belting

The above photograph shows 75 ft. x 48 in. x 10 ply Leviathan Belt.

**T**HE motor is a 500 h.p., 3 phase, 60 cycle, 2,300 volts, 600 r.p.m. This belt has been carrying a load of about 600 h.p. since 1914.

No cost of upkeep; the belt has never been touched since the day it was installed. Our Leviathan and Anaconda Beltings have been sold on a make good basis for over 30 years.

If they hadn't made good we would have been out of business long ago. The fact that our business is progressing rapidly is ample proof of the merit of this belting.

With every belt we guarantee full value in service, dollar for dollar, horse-power for horse-power, and just as we have figured our tables of horse-power for the best results, so in making the above statement, we not only expect to give equal service, but **BETTER SERVICE AND MORE ECONOMICALLY.**

Why not give us a trial order and let LEVIATHAN or ANACONDA prove itself?

## Oneida Steel Split Pulleys

If you are not using this "closest approach to pulley perfection," we have in store for you an additional means of cutting down expense and improving your plant.

For your own best interest—for the sake of your factory overhead—look into this matter of steel pulleys.

And when investigating, you might as well start in at the top, with the steel pulley that has actively demonstrated its positive superiority over all other steel pulleys—the pulley of such construction that not only makes practicable its use for ordinary line shaft work, but is also successfully built, without a change of design, in sizes capable of transmitting 750 H.P.—and more if necessary.

Let us fill your next pulley order with an Oneida. For your convenience we keep on hand a "perpetual stock" of all sizes—your urgent needs can be filled at once.

This advantage is tangible.

Unless a pulley has a face insuring efficient belt contact, it is not an economical pulley to use.

The Oneida is a one-piece perfect oval crown, with no groove running through the centre. All the face surface is efficient surface; the belt uniformly hugs the crown, producing the greatest amount of belt adhesion with the least belt tension. Operating conditions being the same, the Oneida will, for this reason, transmit from 5 to 20 per cent. more power than a pulley having an angle crown that requires greater belt tension to force efficient belt contact and that has a centre groove which subtracts belt area from the most vital point of the face—the centre.

# STABILITY IN

## LINK-BELT SILENT CHAIN DRIVES

**STABILITY** is a permanent characteristic of Link-Belt Silent Chain. Strength, sufficient to overcome all peak loads for a given horse power, is included in every drive.

Flexible as a Belt      Positive as a Gear  
More Efficient than Either

Transmit your power through the reliable Link-Belt Silent Chain Drive. For every turn of the prime mover there is a corresponding turn of the driven wheel. There is no slip—no loss of power or speed. For thirteen years Link-Belt Silent Chain proved its superiority over belts and gears, and is winning constantly increasing recognition for driving every conceivable kind of machinery. Learn more about this 98% transmission—write for Data Book No. 125, our 112-page price list.

**CANADIAN LINK-BELT Co., Limited**

285 West Wellington Street

TORONTO

Link-Belt Company  
Gentlemen—

About two years ago we purchased from you a 150 h.p. Link Belt Silent Chain Drive. This transmission has been in daily operation since it was installed, driving all the brick machinery which has been producing approximately 125 tons of Denison Interlocking Tile per day. After this drive was in operation for 22 months we removed the cover to inspect the chain and clean it if necessary. The writer personally inspected the chain and sprockets, and much to his surprise was unable to detect any wear.

Very truly yours,

# THE JOHNSON FRICTION CLUTCH

## “Spreading!”

The value of the **Johnson Friction Clutch** is finding increased recognition wherever the consideration of **Quality** is allowed to rule.

A large user is the Williams Tool Co., Erie, Pa., who have adopted it for their heavy Cutting Off Machines illustrated here, the capacity of which ranges from 3 1/2 to 5 in. of heavy bar steel.

Single Clutch with pulley mounted on the hub.

The clutches are located in the headstock, as indicated by the arrows, being operated by the simple lever action characteristic of all Johnson Clutches. The clutch is located between two

spur gears and operates both for stopping and starting and change of speed.

If you have not considered the manifold advantages of the **JOHNSON Friction Clutch**—it is nearly time to do so or your machine may suddenly fall into line with the “one-lung” auto and the tall hat—merely objects of curiosity.

“Clutches as applied in Machine Building” is a live book well worth reading by every machinist and machine builder. Why not write for a copy.

*Send for our yellow sheets descriptive of these Clutches.*

## Steady Improvement for 20 Years

Twenty years ago, the first AMERICAN Steel Split Pulley was the best belt pulley on the market—because it was *steel*. In those 20 years it has proved that it wears longer, delivers more power and consumes less energy, because it fans a minimum amount of air as it revolves and allows only a minimum belt slip.

But the steel pulley that we make now differs from that of 20 years ago. With each year improvements were made—nothing radical—but *improvements* nevertheless.

To-day the three million AMERICAN Steel Split Pulleys that have been marketed are the best evidence of unassailable pulley quality.

Addressing us direct, or communicating with the nearest AMERICAN Pulley dealer, will bring you pulley facts vital to your business.

## AMERICAN STEEL SPLIT PULLEY

Over 60,000 pulleys—3 inches to 120 inches in diameter—stocked at centres named below, and additional thousands stocked by over 200 dealers insure prompt deliveries. Write for quotations and delivery dates.

# HALL

**High Speed, Heavy Duty  
SHELL CUTTING-OFF  
and FACING MACHINES  
Also Pipe Threading Machinery**  
Any size  $\frac{1}{8}$  in. to 18 in.

No. 4—For cutting-off and facing shrapnel or for bar stock.

## —for Shells, Bar Stock and Ingots

We manufacture a complete line of machines for cutting and facing shrapnel 4.5", 60 pdr. 6", 9.2" shells or larger up to and including 12", or for bar stock and ingots from 3" to 12" diam., single, double or triple cuts at one chucking.

Hall cutting-off and facing machines have been in operation since shells were first made in Canada, and innumerable repeat orders prove that they are more than ordinary machines.

There are more than a score of our machines in one munition plant.

Let us tell you the nearest point at which you can see some of our machines in operation.

Cut illustrates our No. 12 cutting-off machine for cutting-off and facing 6", 8", 9.2", 10", or 12" shells. The bed of the machine is of the box lathe type, with sufficient weight and strength to give great rigidity under the severest strain.

No. 6—For cutting-off and facing 4.5", 60-pr. 6" shells or for bar stock.

The above illustrates our newest design Gear Box drive, Duplex Improved, Pipe Machine, capacity  $2\frac{1}{2}$ " to 8" inclusive, and is one of our many sizes ranging from  $\frac{1}{8}$ " to 18".

# "LENOX" HACK-SAWS

• THE HACK-SAW OF

**Guaranteed Uniformity**

**COST NO MORE—BUT WORTH MORE**

*Prompt Delivery at All Times.*

**Ralph B. Norton, 126 Craig St. West, Montreal**

*Write for full description.*

This saw also furnished in fine pitch type.  $\frac{1}{2}$  inch to  $\frac{5}{8}$  inch point to point. Inserts of best High Speed Steel.

## HUTHER BROS. Metal Cutting Saws

**This letter from a satisfied user (name on request.)**

"Having just completed a rather large contract for munitions which required sawing of comparatively high carbon steel stock, and on which we have used continuously for over a year your inserted tooth milling saws, we wish to advise you of the very satisfactory service that these saws have given us.

"On account of the small amount of metal removed by your saws, considerable material is saved, and in addition to this much less power is required to drive the saws. They are, therefore, more efficient than any we have previously used, and their use has enabled us to considerably increase our production."

**Huther Bros. Saw Mfg. Co.**  
**ROCHESTER, N.Y.**

# Victor Blade-

## *Canadian Made*

# SAWS

## For Shells

Shell Steel is different — *but* there's a Victor Saw Blade made especially for this work and it gives unequalled service in *high-speed machines*.

*VICTOR BLADES—the only hack saw blades made in Canada.*

Used extensively in Canadian Munition Plants.

*If any advertisement interests you, tear it out now and place with letters to be answered.*

# Pipe Machines

The Panama Exposition Highest Award was given to us for one reason — supremacy. Convenience of design and range of work of each machine stamp Williams Pipe Machine in a distinctive class by itself. Each machine will thread from 8 to 11 consecutive sizes, and there are 11 different size machines operating within their range pipes from  $\frac{1}{4}$ " to 18" diameter. Write us for descriptive matter and specifications.

**HIGHEST AWARDS  
PANAMA EXPOSITION**

# Cut-off Machines

For shells from 3" to 12" diameter is the range of cutting off powers of these machines. Its strength is its life. European and American munition plants have installed great numbers of these machines — why were these chosen over numerous other makes? For one reason—supremacy. It is built for speed, no waste energy, no false motion. They have to be good to lead in their line. Where shall we write you about it?

# For Testing Shrapnel, Other Shells and Parts THE SCLEROSCOPE IS USED UNIVERSALLY

Scleroscope at Work.

The British Government specifications are that a shrapnel shell shall strike between 43 and 50 after heat treatment. Shells falling below this are rejected.

The scleroscope is depended upon to give accurate results. It does this or it would not be specified by the British Government.

The scleroscope has been adopted by the various governments for testing shells and projectiles because it is fast as well as dependable. If you want to *know* the physical qualities of steel, and other metals, use it.

*Booklet on request.*

The Scleroscope on swing arm.

## For Heat Indication Use The PYROSCOPE

Is the common-sense heat measuring instrument that makes straight for results without fuss. Costs least of all; burns simple kerosene; never varies. It is the one available trusty in the grimy hands of furnace men, hardeners, carburizers. It is a pet in the laboratory; and is also being universally adopted by colleges for demonstration purposes owing to the correctness of the principle utilized. Our best customers are those who have tried all other means of heat measuring.

*Send for our free circular  
P. and list of users in the  
United States.*

"NEW BRITAIN"  
SHOP FURNITURE  
NEW BRITAIN

"NEW BRITAIN"  
SHOP FURNITURE  
NEW BRITAIN

## Convenience and Durability

THE embodiment of these two qualities in the fullest degree is a fixed ideal in the design of every item of "New Britain" Shop Furniture.

WE have constantly resisted every temptation to sacrifice either of these qualities for the sake of a slight saving in the first cost, knowing full well that the resultant loss of efficiency in use would offset any initial saving many times over.

THE wisdom of this policy is verified daily by the increasing number of factories in which "N.B." has come to stand for "None Better" as well as "New Britain."

WITH a few exceptions these articles were originated in our own plant to supply a real shop need, for which makeshifts of home-made construction had previously been the only thing available.

IF you are not so fortunate as to have already discovered the time and labor-saving possibilities of the "New Britain" Line, our Shop Furniture Catalog should prove a gold mine of suggestions for improving the efficiency and orderliness of your factory.

Shall we send it?

# High Speed Hammers

**S**PEED and quality of production are an ideal combination—if you can get them without damaging your machine. Speed usually puts exceptional strain on the vital parts, thus weakening the machine and repair expenses are high. With a High Speed Hammer, this danger is eliminated. It was built for speed. It is featured by economy in floor space, quality of production, elimination of weight and a *guaranteed* saving of 15% to 20% on any class of work. The life of the machine is practically indefinite, as phosphor bronze bushings are used throughout.

No riveting too intricate. Send for our catalogue on High Speed Hammers.

# Turn Your High-Speed Scrap Into Tools That Will Outcut Solid Tools

**WE** WILL use your **HIGHSPEED STEEL SCRAP** for a **TIP** on a carbon steel shank — any size of tool—weld them permanently by our patented process, and return you a tool that will produce better results than a solid tool of the same kind of high speed steel—and at a small fraction of the cost.

**O**R WE will supply a tool using our own high speed steel and shank, permanently welded and ground, and guaranteed to give perfect satisfaction, at a very low price. This applies to lathe or planer tools, roughing or parting, and special tools.

## TIP-IT Patent Welding Process

**O**UR process is not a temporary braze, but a *positively permanent weld*, and guaranteed in every particular.

TIP-IT treatment actually improves the properties of the high-speed steel tips. They will cut better and last longer than ordinary solid tools. TIP-IT treated tools can be re-tempered or re-heated to any extent without the weld being impaired in any way. When the high-speed steel tips finally do wear out, new tips can be welded to the shank.

With the present scarcity and high price of high-speed steel, tremendous economies may be effected by using TIP-IT tools, and complete satisfaction is guaranteed. *Several large munition manufacturers are already using TIP-IT tools in their plants.* Let us refer you to them. A trial will convince you,—and remember, you are fully protected by our guarantee.

*Write for particulars and prices.*

## "New Britainize" Your Factory—

**THIS** is just a short way of saying—"equip your plant with the most efficient automatic screw and chucking machines." It pays from the start.

Size 24 Single-Head Multiple Spindle Chucking Machine.  
Automatically machines 4 pieces at once.

"New Britain" Six-Spindle Automatic Screw Machine  
"The Machine That Saves Rehandling."

**T**WO TYPES of Automatic Multiple Spindle Chucking Machines are made—the Single Head, for machining castings or forgings on one end and for the performance of second operations on screw-machine products;—the Double Head, designed for finishing both ends of a piece at the same time.

**S**INGLE-HEAD MACHINES are built in five sizes, having either four or five tool-carrying spindles and work-holding turrets with capacities for five and six pieces. Turrets will accommodate any style of holding device—chuck, arbor or collet.

**D**DOUBLE-HEAD MACHINES are made in two sizes, having three tool-carrying spindles on each end, the turret being designed to hold four pieces of work and permit of machining both ends at once.

**T**HE NEW BRITAIN "SIX" possesses many points of advantage which add to the convenience and economy of screw machine work.

**O**NE PARTICULAR FEATURE, however, has given it a unique position in the screw-machine field. This is the use of **six spindles**, which enables it to handle more operations than had previously been possible. On work of a simpler character this extra spindle capacity proves of equal advantage in that it provides for the subdivision of the longer operations. Result—**increased production.**

**F**OR close accuracy and **maximum productivity**, the "New Britain" has no superior.

---

Send us blue-prints of your screw-machine and chuck work and give yourself the satisfaction of knowing how much "New Britain" Automatics would save you.

# ***"Cuts down costs in Riveting"***

That's what they *all* say  
about

## **ALLEN Riveting Machines**

There is no other type of riveting equipment you can put in your Shop that will do as *fast* and *tight* work as the Allen machines.

This also means—*at the lowest cost.*

### **ALLEN "Jaw" Riveter**

This riveter is most suitable for all descriptions of bridge and building construction work. By a special patented device any desired change in the distance between the dies is easily effected.

### **ALLEN "Alligator" Riveter**

This riveter is especially adapted for all types of steel car construction riveting work. Suspended on a double axis, machines of this pattern can be arranged in any position, thus making them indispensable for work of this character.

### **ALLEN "Compression Lever" Riveter**

This riveter is built expressly for heavy bridge, beam and girder work and is widely used for this purpose.

We carry a full line of Allen Riveters in stock to insure prompt delivery. *One* of these is adapted to *your* riveting requirements.

*Send for illustrated booklet showing different types, and full particulars.*

**Monarch Boiler Ratchet**

**Westcott "S" Wrench**

**200M Combination**

**A Trio**

Each one sings a different key of "Keystone Quality"

## "Keystone Quality"

You can pick up a tool and tell by the "feel" of it, as to its quality and usefulness. When you pick up a Keystone it has the "right feel." Work them and they make you feel right.

From the bottom up they are the ideal trio.

The Westcott Adjustable "S" Wrench has a malleable iron handle with a jaw of forged steel. The Westcott Wrench is the original "hidden nut finder." It gets at them from around the corner, but it gets them—that is the main thing.

The Keystone 200 M. Combination Ratchet is a quartet in itself. It has 4 complete ratchets in one. All parts are interchangeable and for convenience and usefulness it is unbeatable.

The Monarch Boiler Ratchet is a mighty convenient tool to have around. How are you fixed?

Get in touch with us!

## Beginning with the Finish

Judging Snips by their finish is like selecting your friends by their clothes. Of course, you want your friends to look well, but what you value them for are qualities that lie under the surface.

With the discriminating buyer of Snips the finish is only the beginning and it is for this buyer that Pexto 1819, Original are made.

From their well-shaped handles to the ends of their clean-cutting blades, they're as nearly perfect as the highest grade steel and the highest class workmanship can make them. Leaders of a line of leaders—the finest Snips made. Nine sizes. Fully guaranteed.

Look for the name on the handle. If your dealer hasn't them, write us. There are many other styles of Pexto Snips, all described in a booklet that's yours for the asking.

The Pexto Pocket Manual is full of ready-reference tables and other information for sheet metal workers, tinsmiths, etc. Free. Send for it.

**PEXTO**

**P.S.&W.**

## REMARKABLE PERFORMANCE OF A REMARKABLE MACHINE

The upper drawing shows a section of the cast-iron sliding sleeve of the "Silent Knight" engine.

In rough-grinding these cylinders in the Stearns plant in Cleveland, the Bryant Semi-Automatic Hole Grinder shows production of **165 cylinders per nine hours.**

We are not surprised at this record. The Bryant has done equally well a number of times. But the reasons for its remarkable performances are always the same—the over-head wheel slide, magnified diameter control, speed of chucking and safety of operation.

Our little blueprint "Production Book" is almost sure to contain grinding examples greatly similar to your requirements. Study it—and compare. Let us send it to you.

**Bryant Chucking Grinder Company, Springfield, Vt.**

# DWIGHT SLATE MARKING MACHINE

## Marking Machines

*For Numbering and  
Graduating Time  
Fuses, Micrometer  
Collars on Lathes,  
Milling Machines,  
101 Fuses.*

One turn of the lever and it is done. An accurate uniform marking or even graduating completed in the flash of an eye. Combined in this machine is the usual "N. & W." quality, together with an intimate knowledge of the requirements of a machine of this character. Simplicity of construction, strength, and accuracy is a description of this machine in a nutshell.

The graduating die is held in holder keyed to shaft; as mark is made shaft revolves with the die, at the same time winding a spring tension which, on contact with work is broken and returns to proper position. Shaft runs in bronze bearings. Depth of pressure is provided by foot through a lever and cam which is adjustable.

Send for Catalogue on General Line of Machines and Steel Lettering Die Engravings.

**Noble & Westbrook Mfg., Co.**  
Hartford, Conn. U.S.A.

## MAKES DIFFICULT PLACES EASY

The B. & C. wrench of the adjustable "S" type will enable you to reach nuts that are inaccessible to other types. This is a feature you will appreciate only when you have tried to reach those places and found how difficult it is and how much longer it takes.

The B. & C. wrench is adjustable by the thumb of the hand that operates it. The operating nut is steel and the sliding jaw of steel drop forging. All parts are interchangeable.

Our B. & C. Combination Wrench does both pipe and nut work. Write for our wrench catalogue.

**Bemis & Call**  
Hardware & Tool Co.  
Springfield, Mass., U.S.A.

## Providing the Proper Thermometer

A Problem for You?

Why not put it up to us?

We know **your needs** and meet them squarely with accurate, servicable Thermometers for your every requirement.

We are specialists in the manufacture of H. & M. Type Thermometers, Recording & Index Thermometers, Automatic Temperature and Pressure Regulators, Mercury Vacuum and Absolute Pressure Gauges, Engraved Stem Thermometers, Hygrometers, Thermo-Electric and Radiation Pyrometers.

Illustration is of *Tycos* Self Contained Recording Thermometer No. 8000 especially adapted for Cold Storage Rooms, but one of many applications however.

Mark this: Every Thermometer bearing H. & M. *Tycos* makes honest claim to supremacy because every manufacturing step is carefully worked out in detail, applications carefully studied.

Put your problem up to us. Our experience will prove very valuable to you,—this we are sure.

# THE BANFIELD PLUG MILLER

*Patent applied for in Canada and United States*

## **THE COMPLETE PLUG FINISHED IN SIX MINUTES BY UNSKILLED LABOR.**

A machine especially designed for finishing base plugs, turning the outside diameter, finishing the face with any camber desired and milling the thread—all in one chucking.

One man can operate two machines, considerably reducing your cost per plug.

The Banfield Plug Miller is equipped with quick draw in collet.

Drive pulley 18" x 6", with bronze bush having cut jaw clutch for turning and facing. Worm gear 100 to 1 ratio with jaw clutch for milling, driven by 10" x 1½" flanged pulley. The milling cutter is driven by an 8" x 2½" flanged pulley. Tool post carriage is equipped with power feed (two speeds), having automatic stop. Power feed pump with relief valve driven, from worm shaft (all drives direct from main line shaft). Rigidly built; simple and economical to operate.

**For Turning and Milling the Thread on Gas  
Check Plugs for 6-inch High Explosive Shells.**

Weight 1800 lbs.

For 18-pdr., 4.5 and 60 pdr. High Explosive Shells. Can furnish machines of same type, weighing 1250 lbs. Particulars on request. These machines are tooled up for finishing plain machined or bevel plugs if desired.

## **BASE PLUGS**

### **Machined to Government Specification**

Have in stock for immediate shipment machined base plugs for 18-pdr., 4.5, 60-pdr, and 6" High Explosive Shells, either threaded or beveled.

Furnished subject to acceptance of Government inspector at your plant.

Capacity 3,000 per day. Write for prices.

## Cut Your Shop Costs

Nobody would think of putting 16-inch lathe work on a 30-inch lathe, then why leave small parts on a large Milling Machine?

A Steptoe Hand Miller or small power feed can be handled quickly and will cut your production cost. You will have less money invested in your Milling Machines and have more machines to do the work.

That same principle applied to your small planer work will cut the cost of planer work.

A Steptoe Shaper will do the work faster because it can be handled quicker.

**The John Steptoe Company,** CUMMINSVILLE  
CINCINNATI, OHIO, U.S.A.

A User's Unsolicited Statement About His "Bliss" Press

**"HAS BEEN USED CONSTANTLY FOR FORTY-SIX YEARS  
AND IS BEING USED AT PRESENT WRITING."**

It is proof that our presses are our best advertisement.

## There is a "BLISS" Press for Every Sheet - Metal - Working Requirement

When you put in presses, why not install "Bliss" presses, that are known in every corner of the globe for their real "press" worth—presses that stand by you year after year?

**BLISS TOGGLE DRAWING PRESSES**—Economical in operation, simple in construction and control. Blank holding pressure is taken by the frame relieving bearings. Our patented toggle motion exerts a uniform pressure during the entire draw. This action facilitates work and requires minimum power. The work produced in every case is smooth and uniform.

Bliss Toggle Drawing Presses, built in sizes to cover all requirements, are successfully meeting modern conditions all over the world.

**BLISS STRAIGHT SIDE PRESSES**—Built in a number of sizes, weighing from 5,000 to 175,000 pounds, are adapted for heavy punching, piercing, stamping, shaping and drawing operations in the manufacture of automobile parts, agricultural implements, cutlery, electrical instruments, and heavy hardware.

There is a size particularly adapted to your needs.

## —for big reductions in handling costs

Handling factory products with the ordinary truck takes numerous trucks and a man to operate each truck. You can effect a saving of both trucks and labor by the use of the

# UNIVERSAL ELEVATING TRUCKS

One man with a Universal can do as much trucking as several men with several ordinary trucks.

All material is stacked on the platforms. To move material the truck is backed under the platform, the handle of the truck is then pushed down, keeping the button depressed, which raises the truck bed, and with it the loaded platform, at the same time automatically locking it in its raised position.

When hauled to the desired position the button is pressed and the handle raised, lowering the platform to the floor. The truck is then drawn from underneath and is ready to move another platform.

Raising and lowering of the truck can be operated with one hand—can be raised or lowered at any angle. Specially designed ball-bearings throughout.

Drop us a card to-day, for full particulars.

A ~~National~~  
Electric Butt  
Welder

## A Question of the Hour

How is the High Speed Steel for that shell job holding out? It's expensive and scarce. By a National Electric Butt Welder and work up all the stubs and short pieces into good tools. Many automobile and machine shops have done this and saved the price of the welder in the first month.

**Example of Saving.**—A set of high speed lathe tools in one shop costs.. \$285.00  
A duplicate set of tools consisting of high speed steel stubs welded to low carbon shanks cost ..... 45.00  
Net saving in outlay ..... \$240.00  
Does this interest you any? If so, write us and get the details.

The National Electric Welder Company have published a small book showing the proper methods to follow in reclaiming short pieces of expensive high speed steel and stellite with the aid of the electric welder. A copy will be sent upon request. We also manufacture a complete line of butt, spot seam and jump welders also electric welders for safe ending locomotive tubes.

---

We make a specialty of designing and equipping complete Munition Plants. Our facilities in this connection will make our service of value to you.

## Case Hardening Efficiency—

**I**S not the speed and thoroughness with which the hardening is accomplished, but when to know the exact moment the process is through. This requires more than the usual amount of temperature control on the part of the operator.

He must know—that point is the one that made us sit up and ponder. But then our experience came to our rescue, and with the result that "Gilbert and Barker" Case-Hardening process allows you to easily find the **exact moment** the

hardening process is through. It maintains a standard, uniform and **constant** heat. Figure it out — would it pay you?

Ask for catalogue 24 for full particulars.

**Gilbert & Barker Mfg. Co.**  
 SPRINGFIELD MASS. U.S.A.

## Are Your Furnaces O.K.?

**R**IGHT now, think of your furnaces—*are they giving 100% efficiency?* If not, will your equipment allow you to do with less. Do you think you have too many furnaces? Probably you could get the same results with fewer number of a better furnace.

The Gilbert & Barker Single and Double Chamber Furnaces embody features which stamp it far in advance of any furnace for similar work.

Built for heat treating, annealing and forging. In our Double Chamber Furnace each chamber is self-acting. One chamber may be

loaded up while the other is heating. This saves time and unnecessary loss of heat. To facilitate the work Furnaces can be supplied that open at both ends, allowing a quicker change. If you will write for catalogue 24 you will get full information, specifications, etc.

**Gilbert & Barker Mfg. Co.**  
 Springfield                      Mass.                      U.S.A.

(1) A Photostat copy of an intricate and detailed specification sheet of which several accurate copies were required. (2) A Photostat copy of an ordinary business letter. (3) A Photostat copy of a blue print required by several departments and different workmen.

This cut shows the PHOTOSTAT in use.

Aside from its speed and low cost, the Photostat has many distinct advantages over other copying methods. One is the fact that copies may be enlarged, or reduced to scale without the loss of time or detail.

### Here are the Ways It is Used and the Savings It Makes in Three Different Lines of Business

#### \$3000 A Year Saved

"The Photostat is saving \$250 a month for us, because it is doing work which was previously done by two draftsmen and a stenographer."

#### Saving \$1100 Yearly

"Not only are we saving eleven hundred dollars a year by the use of the Photostat, but we have increased the efficiency of both our office and drafting departments."

#### Replacing Ten Tracers

"It has enabled us to close down a tracing office formerly employing ten tracers."

## What One Manufacturer Has Done With The PHOTOSTAT

(Reg. U. S. Pat. Off.)

In the drafting, tracing and copying departments of one manufacturer the Photostat has made a saving of about 75%.

And further—the work is more satisfactory. It is photographically accurate, and copying that formerly took days, is now done in minutes.

## Makes Quick Low Cost Copies Directly on Paper

No negatives—dark rooms—nor expert knowledge necessary. All processes are mechanical. The Photostat makes photographic facsimiles of letters, legal papers, maps, blue prints, drawings, financial statements—anything printed, drawn or written—in a few minutes and for a few cents.

### Write for the PHOTOSTAT Book

Send for full information, then compare this method, for speed, convenience, cost and efficiency with ordinary methods of copying pencil sketches, plans, statements and other papers by hand.

Manufactured by the Eastman Kodak Company for the

## WELLS REAMER AND CUTTER GRINDERS

That's what you *want*—a *universal* grinder, one with the everything-at-hand convenience—that's exactly what you *get* in a WELLS.

Then too, consider the wide range of choice allowed you by the Wells way—a No. 184 at \$115. Plain Grinder up to the No. 190 Full Universal—this means that you buy *only* the size machine that you actually *need*.

Wells Grinders have proved their worth under a hundred hard conditions—you need a Wells in *your* plant.

### *Study These Wells Grinder Mechanical Features:*

*Swings 8-in. diameter on centers and takes 16-in. in length between centers.*

*Rack Feed* for longitudinal movement of table gives a steady, even feed.

*Swivel Table* with vertical adjustment so that Cup Wheels can be used. No other moderate priced grinder has this feature.

*Locking Device* so that table can be clamped to the column at any angle and raised or lowered without changing its position.

*Swivel Boxes* which insure perfect alignment of spindle essential to a grinding machine.

## Two Ways of Figuring Threading Production

### PRODUCTION PER DIE:

How long will the die produce before requiring replacement of chasers? This point directly touches economy.

The chasers of the Landis Die have 10 to 20 times the life of any other die, under hard usage. Ground on the end only, there are 3 inches to be used before a new chaser is needed.

### PRODUCTION PER HOUR:

How fast will the die produce?

Here the Landis Die has every advantage. Full natural clearance, and the variable rake angle adjusted to the material to be cut, enable maximum cutting speeds.

Moreover, the cutting contour of the chasers is permanent, consistently producing threads of the highest quality.

Learn the full Landis details in Catalogue No. 22—on request

# Shrapnel and High Explosive Grinding Wheels

Above illustration shows only a few of the many shapes and sizes we are making for this work.

**"REXITE"** Wheels are made under the guidance of over thirty-five years' experience. All made from our own artificial abrasive by either silicate or vitrified process.

We'll be pleased to give you names of many satisfied customers for whom we have *increased production and lowered costs.*

Write our service department for information concerning your grinding needs.

Spindle to Accommo-  
date Shells up to  
Six inches diameter.**

## **The Corbet Improved Heavy Turret Lathes for Shells**

Our Lathes are on active service in over fifty Munition Plants in Canada. When you purchase our lathes and chucks, all you have to do is to instal the lathe, put on the belt and get immediate results, and not have to purchase a chuck, and have to fit it after you have the lathe installed, which means delay. Dupli-

cate orders for our lathes from satisfied customers are quite common. They will increase your output, and render a service, that only those who have them installed can appreciate, and are sold on a positive guarantee to give results. Moderate prices and prompt deliveries. Why not write us to-day?

## **The Corbet Automatic Steam Towing Machines** For Tugs and Barges

These Machines permit the use of Steel Hawsers in place of Manila Hawsers. Steel Hawsers will last at least ten years, whereas the Manila Hawsers only last one season. The money saved in not having to buy new Hawsers every Spring will soon pay for one of our machines. Besides, our machines will

render a service that only those who have them installed can appreciate. These machines are made in four sizes to accommodate steel hawsers from  $\frac{3}{4}$ " dia. up to  $1\frac{1}{2}$ " dia. Now is the time to place your order for delivery April 15th, 1917. Write for prices and general information.

# The Stecher No. 4B Hand Screw Machine

Built with a view to obtaining the greatest rigidity and largest wearing surfaces. All useless adjustments, such as taper gibs in head-stock boxes and gibs under saddle, have been eliminated, as they are just so many extra parts to jar loose, and excuses for curious operators to throw the machine out of adjustment.

Other reasons for superiority are pointed out in our descriptive circular. Better send for a copy.

Friction Head, Automatic Chuck, Wire Feed and Hand Longitudinal Feed to Cut-off, Independent Stops to Turret.

**The Charles Stecher Company, 1574 Crossing St., Chicago, Ill.**

## The Automatic Release Prevents Breaking of Taps

The Tuttle Tapping Machine is adapted for a great variety of work where accuracy is demanded.

This machine will tap holes up to  $\frac{1}{4}$  inch in diameter and have an automatic stop so that it can be set to tap to any depth desired. They are so designed that they combine lightness, strength, ease and rapidity of manipulation with accuracy and uniformity of the work produced. Simple in construction and convenient in operation.

### The Tuttle Tapping Machine

is equally satisfactory on either blind or through holes and tap to the required depth every time, which gives uniform work and prevents the breaking of taps.

#### How is this for Speed?

"We are using these machines for tapping 3" shrapnel, run them 22 hours a day, and each machine will tap from 180 to 200 holes per hour."

#### Or this for Economy?

"We feel confident that the saving in time and taps in two months paid for the machine."

We supply a vertical cast iron column for these machines when desired. Larger sizes on order.

Send for Circular and Prices.

## PARAGON GEAR WORKS

Cable Address:  
PARAGON, TAUNTON

# Rigid, Yet Flexible

## The Flat Turret Lathe is Rigid

in everything that relates to holding the tool and the work firmly in position under the heaviest cuts. The gibbed flat turret; the cross-sliding head; the positive, solid abutment stops; the tool holders, made without overhang and mounted directly over the turret lock bolt; all these constructional features work toward the same end of extreme rigidity.

## The Flat Turret Lathe is Flexible

in everything that relates to machine operation and shop management. Wide range of feeds and speeds instantly obtainable; innumerable stops, longitudinal and cross, front and back; and a set of tools that is available for any piece of work, chuck or bar, that will be met with in ordinary shop practice.

Think what this means in lowering the cost of special tools; and above all in making it possible to change the design of your product instantly to meet changes in demand.

## RIVETT QUALITY

**S**TRONG claims have been made for the high standard of Rivett Quality, and with the full knowledge of the responsibility imposed upon us by such claims, we wish to further impress upon the users and prospective buyers of Rivett products, the fact that we build only the best.

Materials, without regard for competitive costs, are purchased only as they measure up to our requirements. Labor is valued only on the basis of the individual's ability to execute the assigned task with mechanical accuracy, consistent with volume production. Rigid inspection is maintained throughout our processing and assembling.

Each item of our product is finished with the best of paint materials. Unpainted parts are fully polished and there is consistent harmony in the balance of painted and polished parts in the completed units.

Close manufacturing limits are maintained and the newer Rivett products are turned out with full interchangeability of parts. Accuracy is essential in a product of the Rivett class, and we conscientiously believe that we are producing a line in which Accuracy is pre-eminent.

Goods leave our plant in first-class condition, carefully packed and fully protected against rust, dirt and abuse in transportation. However, if through some oversight of our own, goods are not up to the Rivett Standard when received, we are ready to make replacement without cost to the buyer.

The Rivett products are sold at prices based on the general labor and material markets, consistent with quality workmanship and exceptional accuracy.

Rivett products cannot be produced at competitive prices.

## RIVETT LATHES

The Rivett Lathe & Grinder Company manufactures a line of small precision lathes of the following types:

- No. 504.** Plain Precision Bench Lathe of medium weight, suitable for average tool room work. Swing 8", distance between centers 18", beveled edge guideways; equipped with Rivett Type Compound Slide Rest.
- No. 505.** Plain Precision Bench Lathe of heavier construction than the No. 504, suitable for tool room work and light manufacturing. Swing 8", distance between centers 18", beveled edge guideways; equipped with Compound Slide Rest with Rocker Tool Post.
- No. 608.** Back-gearred Precision Lathe of exceptional accuracy and highest grade finish, suitable for fine tool room, experimental and model work, and a wide range of light manufacturing. Swing 8½", distance between centers 22", central V guideways; equipped with Rivett Type Compound Slide Rest, also feed and lead screws and gears for thread cutting.
- No. 705.** Plain Precision Turret Lathe with Combination Stand and Oil Pan, suitable for light forming and turret work on stock up to 7/8" round. Swing 8", distance from chuck face to turret face 17¾"; equipped with Automatic Chuck Closer, Cutting-off and Forming Slide.

Lathes 504, 505 and 608 are designed for bench mounting, but may be furnished with Combination Stand and Oil Pan or Oak-Cabinet and installed as an independent unit. Countershafts of either the wall or ceiling types are supplied. Lathe 705 is furnished only, complete, with Stand and Ceiling Countershaft. Individual motor drive may be furnished with Lathes 504, 505 and 608 when mounted on bench or Oak Cabinet.

We manufacture a complete line of Attachments for our Lathes.

Every Feature to secure strength and stiffness on the heavy cuts is embodied in

## Millholland 1"x7" Screw Machine

The Bed is of box construction, well ribbed, and with the headstock cast solid.

The Headstock is made with plain head three-step cone. The steps of the cone pulley are of large diameter and wide face and are so proportioned as to transmit the maximum power with proper spindle speeds.

The Spindle, high-carbon steel, with hardened and ground thrust washers.

The Cut-off Slide, with broad, flat, well-gibbed bearings.

The Turret is of heavy construction and mounted on a large steel stud.

The Automatic Chuck and Bar Feed, operated by the long lever on the front of the bed, grips or releases the work instantly. The operator with one movement opens the chuck and feeds the bar without stopping the machine.

### *To Our Friends and Patrons:*

We take this opportunity of wishing one and all the "Compliments of the Season."

In this our last advertising message of 1916, we desire to extend to our many friends our sincere thanks for their valued patronage and confidence extended to us during the past twelve months.

We have endeavored to represent and sell only the most modern and reliable machinery, and to render to all satisfactory service and courteous treatment. The response has been indeed gratifying, and is keenly appreciated. During the coming year we hope to have the pleasure of co-operating with you still further.

To our friends who are manufacturing munitions, we invite a careful study of the lines illustrated and described on pages No. 160, 161, 162, 163 and 164 following. From those who are working along general lines, we invite enquiries for such equipment as may be required.

Each line we handle we believe to be the best of its kind from the standpoint of efficiency, as well as of construction.

It is our desire and intense wish that our manufacturers and their valiant workers who have labored so long and so earnestly, may see their efforts crowned with success during 1917.

May the new year bring Victory, Peace and Prosperity for the Empire and the Empire's Allies.

The Lake has just opened its new seasonal ice-harvesting facilities of greater capacity and strength than other harvesting efforts. Check out the results and see the many fishing spots and scenic views. The Lake will stand up to the wind and the waves and the ice will be as strong as ever. Harvesting the Lake's resources is a great experience.

# THE RELIANCE

## HEAVY DUTY TURRET LATHE

Designed and Built Especially for Internal Boring  
of 4.5 and 6-Inch Shells

*Four for Immediate Delivery.*

Is  
Made  
For  
Fast  
Heavy  
Work

FRONT VIEW WITH GEAR GUARDS AND OIL PANS REMOVED

**Note these features and compare with any other make:**

Turret 20 in. diam. Six 2 15/16 in. holes. Heavy set screws and keys.

Turret spigotted on outer edge. Heavy lever and clamp. Boring bar holes in turret faced 1/4".

Index ring and key, cast steel hardened and ground.

Four power feeds 1/64 in., 2/64 in., 4/64 in. and 8/64 in. Instant selection.

Hand feed geared 79:1, 25 lbs. on Capstan gives 2,000 lbs. on tool.

Countershaft fitted with tight and loose pulleys.

Massive one-piece Bed. No bolted joints. Great rigidity.

Cone Pulleys 15 in. and 18 in. diam. for 8 in. double belt.

Back gear 9:1, Main gear 4 1/2 in. face, 3 D.P.

Spindle pocket takes 6 in. shell completely inside.

"Skefko" Ball Thrust Bearing, on Spindle. Capacity 8,400 lbs.

Carriage 42 in. long, 3 in. steel centre rack 4 D.P. No side strain.

Shipping weight, complete, 8,000 lbs.

This Lathe has been designed to meet a demand for a heavy duty boring machine of greater rigidity and strength than other machines offered. Check over the details and note the large driving parts and massive strength. This lathe will stand up to its work and do heavier work than the machines you are now using. Investigate this lathe thoroughly before purchasing.

Modern Self-Opening Die Head.

# A Single Cut Gives a Finished Thread

of Absolute Accuracy  
in Diameter,  
Form, Lead and  
Pitch

Modern Collapsible Tap.

## “Modern” Self-Opening—Adjustable Die Heads and Collapsible Taps

With “Modern” Dies and Taps it is not necessary to take a roughing cut—a single cut finishes the job.

They are properly supported to insure the cutting of a perfectly-straight thread of full size and accurate lead, and will not clog with chips, necessitating frequent cleaning. Cut close to a shoulder.

“Modern” Die Heads and Collapsible Taps are used on all styles of Hand and Automatic Screw Machines, Turret Lathes, Chucking Machines, Drill Presses, in fact on any machine that is used for thread-cutting.

## Magic Chuck Equipment

The simplest, safest, easiest to operate and most adaptable chuck on the market. For use on Drill Press, Lathe, Screw Machines and other Revolving Spindle Machines.

Handles such operations as Drilling, Reaming, End Milling, Counter Boring, Tapping, in fact any operation that can be done on a Drill Press, increasing the output from 20% to 100%.

Made in six sizes—the largest with capacity up to 5% diam. drills.

# Modern Self-Contained Plain Grinding Machines

"MODERN" 8" x 30" Self-Contained Plain Grinding Machine.

Work speeds and table feeds entirely independent and cover every range within the capacity of the machine. Automatic feed at either or both ends of table reverse. Auxiliary feed for bringing the wheel into work without traversing table. Positive stop provided when feeding the wheel by hand. Head stock entirely belt driven. Steady rests that are universal in all their movements and have positive stops for grinding duplicate work. Interchangeable wheel centres.

Tools that have proved themselves invaluable for their speed, accuracy and economy of operation.

Absolute central control—all levers and hand wheels concentrated on front of Machine — quickly and easily operated.

"MODERN" 12" x 24" Self-Contained Plain Grinding Machine.

## —Modern Die Chaser

Those who value accuracy and correctness in gauge of thread will find, by using the MODERN CHASER GRINDER that each Chaser will do its portion of duty, being ground true to the axis of the head, and that the life of the Chasers, as well as that of the Die Head, will be greatly prolonged.

PROMPT DELIVERIES.

Bulletins upon Request.

# See This Chuck!

**It will Chuck a  
Piece of  
Work in  
5 Seconds**

**Increases production from  
25 per cent. to 50 per cent.  
depending on the length of  
operation.**

***Are you making Shells, Shrapnel,  
Fuses or Piston Rings?***

If you are, get in touch with us. We want to lay a cost-cutting plan before you. We want to prove to you that

## **Detroit Pneumatic Chucks**

will chuck a piece of work in five seconds. **THIS** is just about fifty-five seconds quicker than it can be chucked by hand.

The shorter the operation, the more chucking and the greater the saving with **DETROIT "AIRGRIP" CHUCKS**.

They fit all hollow spindles and are made entirely of steel. Gripping power is adjustable.

Made in two-jaw and three-jaw types. All sizes from 6" to 18" diameter.

Our Chucks are made entirely of steel; our workmanship is of the very highest grade; our air cylinder is a decided improvement over anything else on the market, as packing on piston is adjusted automatically.

We are just completing a new factory which will be the largest and best equipped plant in the United States for the exclusive manufacture of pneumatic chucks.

We have some open territory and will be glad to hear from good, live agents.

*"We can chuck parts of any kind"*

**Detroit Pneumatic Chuck Company**  
**DETROIT, MICH.**

# Barker Chuck

*No Wrench*

*No Air*

*No Friction Losses*

**Its Ease  
Solved—**

ONE wonders what the internal construction is like when they see the smooth, speedy ease of the Barker Wrenchless Chuck in operation. Yet look at the above illustration. No intricate mechanism; it is not dependent upon any mechanical assistance; it is self-acting, self-contained, and as the illustration shows, it is a model of simplicity.

Having all the advantages of air operated chucks in speed and positive operation it eliminates the air compressors, pipes and valves. Takes no more time to mount than an ordinary chuck, and being self-contained any number may be mounted.

*Manufactured by*

# BARKEY EMERY GRINDERS

**B**ARKEY Grinders are extensively used throughout the Dominion and judging by repeat orders are giving the best of satisfaction. Uniformity of product is one of the most important factors in manufacturing and we believe it has been the means of establishing Barkey Grinders so favorably in the opinion of Canadian Manufacturers. Into every one of our grinders go the finest materials, the best workmanship and the greatest care, resulting in

*a combination of Strength,  
Accuracy and Durability  
that's hard to beat.*

**T**HE Barkey No. 4 is made strong for all kinds of heavy grinding, and is suitable for car, foundry, machine and plow shops, etc. The Barkey No. 1 Round Column Emery Grinder is a light, compact, smooth-running machine suitable for all kinds of fine work, such as grinding self-hardening tool points used in machine shops; knives for molding machines in planing mills; and with the Barkey Skate Attachment makes a very complete machine for sharpening skates.

We also manufacture Brass Valves, Valve Milling Machines, Water Elevators and George Lumber Measuring Machines.

## ADVANTAGES

secured by the use of this machine as compared with a reciprocating filing machine for finishing blanking dies:—

1. Work drawn down on table or platen.
2. A wide range of surface contours finished without change of cutters.
3. Surfaces finished with uniform degree of clearance regardless of direction from which work is applied to cutter.
4. Chips carried downward, not deposited on top of the die to obscure the pattern or layout.
5. Will remove very much more material in a given time than is possible with a reciprocating file.

## Smooth Running, Efficient Machines for your Heavy Grinding Jobs

You can get with these machines steady, rapid production and work that will meet your most exacting standards for accuracy and finish.

Constructed with ample thickness of metal throughout and strong bracing at all points of stress, they have the stability required in machines for heavy manufacturing work. But careful calculations have eliminated all unnecessary weight that would tend to make these machines clumsy and slow to operate. They have large,

well-supported and accurately aligned bearings which assure their reliability in long continued service.

A simple, handy control is provided with speeds and feeds entirely independent, insuring the very fastest production, consistent with the finish required.

You should know more about these and other features, such as the Automatic Cross Feed, Universal Back Rests, etc. Write us for a descriptive circular of machines best suited to your work.

## Production and Satisfaction

are the reasons for so many large concerns repeating their order for PEERLESS HIGH SPEED HEAVY DUTY METAL CUTTING SAWS. One order just came in for forty-two machines.

It is also surprising the reports that are coming in stating the universal satisfaction that this tool is performing. Some of these reports are from concerns that have never been able to do their work satisfactorily on this class of machinery before, but the PEERLESS has solved this problem and they are now enabled to do this work better and cheaper than ever before.

Owing to the increased production on the PEERLESS instead of using a number of machines one will do the work, which not only saves in the purchase price of the tools, but in many cases dispenses with enlarging your factory. Or, in other words, you would have floor space to spare.

We have a trial proposition to offer on this tool that is so interesting that no manufacturer can afford to pass it up. Write us and we will submit such news that will completely revolutionize everything in this line.

**PEERLESS MACHINE CO.** 1607 Racine St.  
RACINE, WIS., U.S.A.

## Tool Room Grinding

is daily becoming a more important feature in the operation of all machine shops. With its increasing importance comes also a better understanding of the necessity for the right grinding wheel.

For instance: 46 grain vitrified Alundum wheels, grades K to L, can now be regularly recommended for twist drill grinding—

**Alundum**

For Steel and  
Steel Alloys

While one of the most popular wheels for gear cutter grinding is Alundum 3846-K—

And for grinding lathe and planer tools of high speed steel are the medium grades M, N, O and P. Alundum, in grains ranging from as coarse as 20 in the larger wheels to as fine as 80 in the smaller ones.

The subject of Tool Room Grinding has been treated in the recent issues of "Grits and Grinds" — may we send you back copies?

"Grant that with zeal and skill this year, we do  
What us do behoves, what Thou command'st us do  
Grant that we do it sharp, at point of moment fit  
And when we do it, grant us good success in it."

**I**NDUSTRIAL prosperity has been an outstanding feature of the year 1916 on this North American continent. As might be expected, war in Europe and on the high seas has been in large measure responsible for its inspiration and attendant development. Canada, through her efforts in munitions production—to refer to but one phase of her Allies-aid activities, has demonstrated not only a readiness to grapple promptly with an emergency, but, as well, an ability to muster her resources in its successful reduction. Her metal-working plant capacities have, on the one hand, been increased, at least, twofold, while, on the other, her pre-war conservatism as to variety product and market scope is no longer existent. In the editorial and advertising columns of this issue, there is demonstrated the evidence of fitness to meet in the first instance the war-created needs of our Allies during and following the life and death struggle now in progress, and secondly, to establish and develop trade relationships in neutral countries, where hitherto we have had no part.

In the various spheres of resources, transportation, and manufacturing development,

aside from their relation to war-time requirements, little, comparatively speaking, has been undertaken, particularly with respect to the breaking of new ground. As in 1915, railroad extension may be said to have reached the irreducible minimum, and in large measure the same is true as regards improvement and upkeep of rolling stock, roadbed and terminal facilities. Work has proceeded at a moderate pace on the new Union Station at Toronto, the C. P. R. Rogers Pass Tunnel, and at the Halifax new Ocean Terminals, while the new C. P. R. station in Quebec City has been com-

pleted and opened this year to traffic.

In the realm of finance, our banks have again made a good showing, and perhaps not the least reason for the very gratifying position in which they find themselves is that arising from their co-operation in the matter of substantial cash advances on Canadian shell contracts to Imperial Government account.

No public works of importance have been initiated or completed during the year, and only those of urgency and involving comparatively small outlays have been given attention. The new Welland Ship Canal, started previous to

the outbreak of war, has been substantially advanced in construction, a detailed account of the work done to date being found in another section of this issue. Due to the desire to conserve to the fullest extent our men, material and cash resources, it is understood that work on the Canal will not be resumed until some date following the cessation of hostilities.

Iron, steel, and metals, have as usual, in this issue, a department especially devoted to their activities during the year, on which account but a brief reference need here be made. In spite of the fact that steel plant

#### LA CAPACITE DES FABRIQUES DU CANADA

**S**UR le Continent de l'Amérique du Nord, la prospérité industrielle est très en évidence pour l'année, 1916.

Aussi, cette guerre effroyable en Europe sur terre et sur mer, est grandement responsable, comme on peut le croire de cette inspiration et de ce développement qui l'accompagne.

Le Canada, en raison de tous ses efforts pour fabriquer des munitions,—ce qui n'est qu'une phase, d'activité pour aider les Alliés—a démontré non seulement sa prompte bonne volonté contre des circonstances inattendues, mais, encore son habileté pour rallier toutes ses ressources et pouvoir surmonter cette position difficile avec succès.

La capacité de ses fabriques de métal est augmentée d'au moins du double, et la "vieille routine" qui existait avant la guerre, et qui paralysait la variété de la production et l'écoulement des marchandises, n'existe plus aujourd'hui.

Le numéro de ce journal dans les parties de rédacteur et de réclame, démontre:

1. Que l'on peut subvenir aux demandes des Alliés pendant cette lutte de vie et de mort et aussi "Après."

2. Que l'on peut pour l'avenir établir et développer des relations de commerce avec les pays neutres, qui jusqu'à présent n'étaient pas en relations de commerce avec nous.

Afin de pouvoir faire connaître les ressources naturelles et les ressources industrielles du Canada; et pour créer un commerce réciproque entre votre pays et le nôtre, ce numéro du journal est un sur mille que nous envoyons par courrier aux personnes à l'étranger dont les noms se trouvent sur une liste spéciale et que nous prions de nous aider de tous leurs efforts pour arriver à ce but.

may be said to shame like conditions in the steel market. The result has been that publishers have been compelled to cut down space, use in many cases an inferior quality of paper, and to increase subscription rates in addition. The situation has become so acute in these closing weeks of the year, that Government action towards an understanding between producers and consumers may be said to be pending at an early date.

Speculation continues to be indulged in as to the more immediate effect the transfer of hostilities from the battlefields of Europe to the wider fields of world trade and commerce will have—either in the restriction or expansion of our industrial activities. We struck a new stride in manufacturing during 1915, and have materially extended it during the past year, both as regards expertness in solving new problems and in the devising of methods and appliances whereby reduced cost and higher class product have resulted. Steps are undoubtedly being taken by our plant executives to make easy the transition from war-time commodity production to those of peace-time, and to establish the necessary and effective connections to fill the gap promptly. Their experience in grasping the manufacture of shells and making same a huge success will, we think, be sufficient guarantee that, when the last shells are being turned, the raw or semi-finished materials entering into readily marketable commercial commodities will be within the machine operator's reach in quantity considerable.

### CANADA'S TRADE

CURRENT trade returns show that the volume of the external trade of Canada is now greater than at any previous period in the history of the Dominion. For the fiscal year ending March 31 last, the grand total of the imports and exports of merchandise—taking no account of the movement of coin and bullion—was just a trifle less than a billion and a quarter dollars. In all its

was \$1,754,143,710. In the last twelve months before the war, the total for the same trade was \$995,152,685. The increase during two years of war is thus \$560,621,549, or more than the whole trade in the fiscal year 1911.

### COMPANY INCORPORATIONS IN NOVA SCOTIA

DURING the fiscal year of the Province of Nova Scotia, ended September 30 last, company incorporations numbered 102, as compared with 97 the year previous, and 168 in 1914. Every Company, whether domestic or ex-provincial, having gain for its purpose or object, is required to be registered and pay an annual registration fee if it does or carries on in Nova Scotia any part of its business. During the last fiscal year, Companies so registered numbered 922, as against 911 the previous year. During the year in which 168 Companies were incorporated, there was great activity in the province of Nova Scotia, in connection with the raising of foxes and fur-bearing animals, and 68 of the 168 companies were formed for that purpose; the following year only eleven such companies were formed, and last year only five.

The Clyde Shipbuilders' Federation responding to the request of the British Board of Trade to consider steps necessary to accelerate the production of merchant vessels declares the first essential is immediate total prohibition.

### LA CAPACITA DELLE FABBRICHE IN CANADA

**L**A PROSPERITA industriale sul continente dell' America del Nord è di tutta evidenza per l'anno 1916. Questo straordinario sviluppo nel commercio è dovuto hélas! alla guerra attuale. Il Canada in più dello sforzo fatto per venire in aiuto con il grande consorso delle sue fabbriche di munizioni è dimostrato non solo l'amore della patria, ma ancora la sua abilità per riunire tutte le sue risorse e vincere tutte le grandi difficoltà.

Le fabbriche metalurgiche hanno aumentato del doppio, é la vecchia "routine" che esisteva avanti la guerra, e che paralizzava la varietà di produzione e la vendita in mercato, non esiste più al d'oggi.

Il numero di questo giornale nella parte editoriale e reclame dimostra primo: che si può rispondere vittoriosamente a ciò che domandano gli alleati per la durata della guerra, secondo che si potrà per l'avvenire stabilire e sviluppare le relazioni commerciali con i paesi neutri che fino a presente ignoravano affatto il Canada. Di più poter far conoscere le risorse naturali e le risorse industriali del Canada, creare un commercio reciproco fra il vostro paese e il nostro.

Inviando questo numero noi preghiamo i nostri lettori di ogni nazione e di ogni paese, di riunire tutte le loro volontà a fine che un comune sforzo possa dare i risultati che il Canada spera.

divisions trade is now expanding at a marvellous rate.

Imports for consumption in 1916 were greater by 11 per cent. than in 1915. Under the stimulus of war orders, the export trade shows a more startling development. Exports of Canadian goods in 1916 exceeded in value similar exports in 1915 by \$318,000,000, or 69 per cent. Statistics for the months of April to October show that this rate of increase is being well maintained.

For the twelve months ended October the total of imports for consumption, and the exports of Canadian produce

# Our War-Created Opportunities and Responsibilities

Contributed and Selected

*Being expressions of opinion from men prominent in the administration and management of iron, steel and associated enterprises regarding developments in trade, commerce, agriculture, manufacturing, etc., during 1916, and their bearing on the immediate and more remote future outlook relative to our Dominion. Optimism will be found predominant.*

## BANK MANAGER'S VIEWPOINT

By Sir F. Williams-Taylor.\*

**T**HE outstanding business feature in Canada is an industrial condition more abnormal in character than ever before in her history. Our much criticized adverse trade balance has disappeared as though by magic, and our exports are now vastly in excess of our imports. Many of our great industries have converted big floating debts, a cause of anxiety, into cash surpluses. Not only is unemployment unknown, but unskilled labour commands wages two and a half times greater than the pay of our volunteer citizen soldiers, who so splendidly risk their lives for their country, while men engaged on "factory piece work" can earn as much as a college professor. It is, therefore, not surprising that the unanalytical minded, or those preoccupied with their own affairs, or those who have not contributed in flesh and blood to the Cause, should complacently say "Times are good." Among those who do not join in this refrain are the men and women of the salaried class and those with small fixed incomes. These have been hard hit by war prices and are indeed finding it difficult to make both ends meet.

The present buoyant industrial conditions are obviously the direct outcome of a steadily increasing demand by the Allies for food, clothing and other munitions of war at rapidly rising prices, yielding large profits to the producers.

In many respects conditions in Canada are comparable with those in the United States. In two notable respects they differ. Our neighbours across the border are adding to their wealth at a pace without precedent in history, but, unlike the Dominion, unpunished by increasing national debt and loss of human life. The transient nature of our increased exports alone is a simple index to a situation that commands the attention of all thinking people.

There are two obvious means of lightening Canada's coming burden, viz., thrift and immigration. The two are closely allied, for only by practising national and personal economy or thrift can we reduce our high cost of living—that most effective barrier to

immigration. Upon immigration we mainly depend for the fuller development of our unsurpassed natural resources. Thrift is overdue but can be started forthwith; immigration must wait, but should follow in natural sequence. I have no words at my command with which to adequately urge the necessity of an organized and an individual effort to promote thrift.

We are going to win the just war we are waging, we are bound to win the war, but let us emerge from it unexhausted, in order that the victory over our enemies may be perpetuated and recurrence of such insensate destruction rendered impracticable. With the advent of peace will come relief to our Empire, but to financial and trade conditions peace will bring a necessity for sudden readjustment that in Canada, as elsewhere, must tax every resource to the utmost.

## THE UNIVERSITY VIEWPOINT

By R. A. Falconer.\*

**T**HE war has brought forward more prominently than ever the place that the universities fill in the industrial and manufacturing pursuits of a country. The most obvious fact is that we must rely more and more upon expert knowledge, and the training for this is given in the faculty of applied science and in the pure scientific departments. What could we do without our engineers, our chemists, our officers of health? Chemistry is going to play an enormous role in the future. Experts will be needed in special laboratories in almost every large industry. Problems of manufacture, agriculture, and the conservation and development of natural resources will have to be solved by highly trained men in the laboratories. Only the universities can supply the discipline which will turn out men of high grade, and when advisers are wanted on scientific questions the professors of the universities will be increasingly called upon. In the economic struggle that will follow the war, success will come to those who have knowledge, who know how to apply that knowledge, who can eliminate waste, and who with trained minds can get results which are only obvious to the man who has the scientific eye.

The story has not yet been told of the

contributions that have been made by the scientists of British and Canadian universities for the conduct of this war. It will be a revelation to many to discover what surpassing service the leading scientists have rendered in the way of making suggestions in munition work, devising instruments in connection with processes of war, and in securing economic results in all the branches of industry. I feel justified in stating that the development of all countries in the future will be in proportion to the development of their universities. Those will be in the van who have the scientific men trained and ready to lead.

## SHIPBUILDING VIEWPOINT

By John S. Leitch.\*

**T**HE prospects for Canadian shipbuilding are bright, and will be bright just as long as British shipbuilders have enough work on hand to keep them from entering into competition. As soon as they overtake part of the arrears caused through the loss of so many ships submarined, then there will be no hope of the Canadian shipbuilder getting orders in the open market. From the latest reports, the building of a great many merchant ships is now being undertaken in Great Britain, and, while the loss of tonnage has been enormous, the facilities for quick output there are also enormous. The only way the Canadian shipbuilding industry can live after normal or nearly normal conditions prevail will be through some form of Government aid, which has always been necessary, and will be more so in the near future.

Shipbuilders all over are experiencing the greatest difficulty in securing steel, and the necessary labor to construct ships. The outlook for material particularly is not very promising, as the great demand on the steel plants for munitions steel is almost enough to keep them running to capacity, and until this demand slackens it will be difficult to get anything like reasonable deliveries or prices. At the present time steel in Great Britain costs considerably less than what Canadian shipbuilders pay, and while the cost of labor has gone up considerably in the Old Country, it has not gone up to such an extent as over here. Inquiries are numerous, and those shipbuilders who are fortunate enough to get

\*General Manager, Bank of Montreal.

\*President University of Toronto.

\*Manager, Collingwood Shipbuilding Co., Collingwood, Ont.

material and labor in sufficient quantities will, no doubt, secure abundance of work for the next four or five years.

A great deal has been written and published in the press recently re Canadian Order-in-Council regarding the 99 per cent. drawback of the duty paid on materials entering into ships, and the general impression is that this will be a great help in building up the shipbuilding industry. The people who have already written on this subject are evidently not intimately acquainted with the matter, as the relief afforded by this drawback is not of so much importance as might appear on the surface, and would only amount to a very small proportion of the cost in present-day vessels.

### IRON AND STEEL MERCHANDISING VIEWPOINT

By J. T. McCall.\*

A SURVEY of the Canadian iron and steel industry and its allied branches during the past year shows a marvellous increase in the capacity of our mills and producing plants. We have been called upon to adapt ourselves to unusual conditions, to supply a demand that was never contemplated when the present iron and steel plants were built. These plants have been greatly enlarged during the past year, and the opportunities of trade offered have been advantageously taken care of. The extraordinary results which have followed the efforts thus put forward to meet the home and also the export requirements in finished iron and steel have inspired a confidence in our manufacturing departments which will carry us on to greater success, larger expansion, and a more thorough development of our natural resources.

We do not refer to the manufacture of munitions, which has been developed on an enormous scale, because this is recognized as being more or less temporary, and will cease when the war is over. Shipbuilding is receiving considerable attention, and promises to become an important and permanent branch of our industrial life. Already much has been accomplished in this direction, in the West as well as in the East, and much more is under contemplation. Car construction and locomotive building have shared in this development, and numerous satisfactory contracts for foreign markets have been handled; others are in course of being negotiated.

There will necessarily be an adjustment to some extent later on, but the connections that have been established for our goods in the markets of Great Britain and our Allies will undoubtedly be of a permanent nature. From every point of view our industrial position is highly satisfactory, and promises great things in the future. We are limited at

present by the scarcity of labor and raw materials, both of which are quite inadequate to the demand.

### RAILROAD PRESIDENT'S VIEW-POINT

By Baron Shaughnessy, K.C.V.O.\*

CANADA has assumed a heavy portion of the burden of the war, far greater than any one anticipated. Canadians have done men's work, fulfilling the terms of the partnership that exists between the various members of the Empire. Canada will, in fact, be a senior partner in the British Empire, bearing an equal share of the burdens, reaping an equal, proportionate share of the profits, and filling a prominent seat at the council table.

This war is developing the individual. Every man, woman and child must do a share. Women in the United Kingdom

"We appeal to the nation to assist the Government in distributing our resources, so that no man shall suffer hunger because somebody else has too much. That means sacrifice; but the men on the Somme are enduring far greater sacrifices. We cannot have equality of sacrifices, but we can have equal readiness for sacrifice from all. Let the nation place its comforts, luxuries and indulgences on an altar consecrated to the fighting men. Let us proclaim a national Lent during the war. It will strengthen our fibre, our spirit. Unless the nation as a whole shoulders part of the burden of victory it will not profit by the triumph. It is not what a nation gains, but what it gives, that makes it great."

—David Lloyd George.

are taking men's places, and they have demonstrated that they can do the work men heretofore have done and just as efficiently. They work on the railways, manufacture munitions, do the farm work, in fact, there is nothing except the actual fighting in the trenches that they are not doing. Every woman at man's work puts another rifle on the firing line.

As to Canada's future, I have always been certain. The war has only hastened development. With the population nearly equivalent to that of New York State and a territory larger than the United States, her possibilities are vast. The quality of her fighting and her share in the war has carried her name to remote corners. Before the war, immigration was rapid, but not a measure to what it will be when peace

is declared. I firmly believe that Canada will have an influx of population not unlike that in the United States about fifty years ago.

A great deal of money and many thousands of settlers have already come to Canada from the United States. The investor finds there a good field for his wealth and the settler a fertile soil for his plough. Rewards have come quickly in both. Canada looks to the United States more than she ever did before for two reasons. Money and men are plentiful there, and the supply from overseas is cut off.

### STEEL CORPORATION VIEWPOINT

By Mark Workman.\*

THE action of the U.S. Federal Reserve Board will help Canadian business. We are quite willing to accept the credit of the British Empire if the existence of an anti-ally sentiment on the Federal Reserve Board makes such action necessary. The credit of the British Empire is sound without a doubt, and no action of this character can affect its fundamental position. Our enemies have unwittingly assisted us by their action. Other allied business than the munitions business proper will be inclined to seek Canadian sources. The steel industry will be amongst those so benefited. It occupies, of course, a relatively stronger position than ever before. Prices are strengthening up and production is keeping pace with same. Buyers, rightly enough, are holding off in purchases as far as possible until lower prices permit them to make renewals. Nevertheless, actual necessities in war orders and industrial needs absorb all available production.

This condition makes it seem reasonable to suppose that demand will continue good for domestic account after the war, particularly in the case of replacements which are now being deferred. A similar demand for replacements on export account may be expected when prices reach normal again. It is hard to see any let up in the demand for steel for some time to come, notwithstanding the desirability of maintaining a conservative attitude on this important question.

Canadian steel makers hope after the war is over to be on an equal basis with the United States. Output is being increased by the addition of further equipment which will of course require some time to be put in operation but eventually a large portion of present earnings will have been applied on betterments which will increase the output and reduce the costs of same.

\*Vice-Pres. and Gen. Mgr., Drummond, McCall & Co., Montreal, Toronto, etc.

\*President, Canadian Pacific Railway Co.

\*President, Dominion Steel Corporation.

# Obituary Record of Canadian Business and Public Men

*The year 1916 bears away on its bosom, at least, its fair share of our business and public men—young and old, although due to the sacrifice exacted by war service, we are perhaps poorer than otherwise, especially as regards the former. Whatever the circumstances, the record of their passing to the Great Beyond merits specific reference being made to their place and part in the upbuilding of our national fabric; industrial and otherwise.*

**Hon. F. T. Frost**, president of Frost & Wood Co., Smiths Falls, died last August.

**H. W. Aird**, manager of the Canada Paint Co., Montreal, died suddenly at his residence, Elm Ave.

**Wm. J. Chaplin**, vice-president of the Welland Vale Mfg. Co., St. Catharines, Ont., died on April 11, aged 57.

**Charles Booth**, chairman of the Booth Steamship Co., died in London, England, on November 23, aged 76.

**Joseph Alfred Gendron**, founder of the Gendron Mfg. Co., Toronto, died at Ottawa, on November 25, aged 76 years.

**Redmond Quain**, a director of the Ottawa Electric Railway Co. and Ottawa Car Co., died at Ottawa on October 5, aged 56.

**Robert Archer**, a prominent business man in Montreal and a director of the Northern Electric Co., died on January 7, aged 79.

**Joseph T. Rolph**, founder of the firm of Rolph & Clark, lithographers and engravers, Toronto, died on June 13, aged 84.

**S. H. Reynolds**, chairman of the Greater Winnipeg Water District Commissioners, died suddenly in Chicago on June 16.

**William J. C. White**, head of the firm of R. C. White & Co., engine and boiler makers, Montreal, died in that city on March 24.

**David Alexander McIlroy**, manager of the Hamilton Steel Construction Co., died at Hamilton, Ont., on April 9, aged 35.

**F. W. Harrison**, president of John Harrison & Sons, Co., sash and door manufacturers, Owen Sound, Ont., died on Feb. 9.

**Thos. L. Morrissey**, for 44 years mechanical superintendent for Robert Mitchell & Co., Montreal, died there on Oct. 22, aged 72.

**Mayor Norman C. Pilcher**, formerly general manager of the Sherbrooke Railway & Power Co., was killed in action early in May in Flanders while serving with the Canadian Mounted Rifles. Major Pilcher was born in Eng-

land 36 years ago, but had lived in Canada for 24 years.

**Thomas Tomlinson**, head of the firm of Thomas Tomlinson & Son, iron founders, Frederick Street, Toronto, died on Feb. 22, aged 45.

**Graham Fraser**, a pioneer of the steel industry in Canada, died at New Glasgow, N.S., on Dec. 25. The deceased was 68 years of age.

**Arthur H. Chadwick**, director and manager of the Canadian Chadwick Metal Co., of Hamilton, Ont., died on November 8, aged 50.

**J. W. McCallum**, for many years superintendent of the Amherst branch of the Canadian Car & Foundry Co., died at Amherst, N.S., on Feb. 16.

**Robert Hastwell**, superintendent of the International Malleable Iron Works at Guelph, Ont., passed away last October following a short illness.

**Alexander Ramsay**, head of the firm of A. R. Ramsay & Sons, paint and varnish manufacturers, of Montreal, died there on Jan. 14, aged 76 years.

**Virgil G. Bogue**, a well-known engineer, died last October. Mr. Bogue was born at Norfolk, N.Y., in 1846. He took a prominent part in engineering projects on this continent.

**Hugh Wilkinson**, former mechanical superintendent of the Brockville branch of the Canadian Northern Railway, died at Brockville, Ont., on August 27.

**Edwin F. Goodison**, president of the John Goodison Thresher Co., of Sarnia, Ont., and one of the province's well known manufacturers, died on Oct. 29, aged 44.

**Frederick Wells Avery**, of Ottawa, millionaire lumberman, died on May 11 at the General Hospital, Montreal. He was born in New York in 1852, and came to Canada in 1878.

**J. Kerr Osborne**, formerly vice-president of the Massey-Harris Co., Toronto, Ont., died on Jan. 14, at Bournemouth, England. Mr. Osborne was born in Beamsville, Ont., on July 27, 1843.

**J. Howard Jackson**, head of Jackson & Co., civil engineers, died on October 7. He was born in England in 1847, and came to Brantford, Ont., in 1912 to join his son in the engineering business.

**Charles Hodgson Osler**, civil engineer of the Montreal Light, Heat & Power Co., Montreal, died on July 8, aged 56. The deceased was born in Sheffield, England, and came to Canada in 1872.

**William Angus** for many years manager of the Royal Pulp & Paper Co., died at Montreal on May 12 aged 81. The deceased was born in Glasgow, Scotland and came to Canada 63 years ago.

**Captain John Simpson**, veteran Canadian navigator and shipbuilder, died on June 3 at his home, Owen Sound, Ont., in his ninety-first year. He was born in the Bay of Quinte district near Belleville.

**Robert Paton Dawson**, for some time foundry superintendent with H. R. Ives & Co., and for 18 years machine shop foreman with J. & R. Weir & Son, Montreal, died in that city on January 25, at the age of 67.

**John B. McDonald**, who conducted a foundry at Tiverton, Ont., for many years, died there on January 31. The deceased was born at Ross Mull, Argyleshire, Scotland, 78 years ago, and settled in Tiverton at the age of 18.

**Ernest G. Barrow, C.E.**, late city engineer of Hamilton, Ont., died in Toronto on July 21. The deceased was born in Bristol, England, in 1846, and came to Canada in 1871. He was appointed city engineer of Hamilton in 1896.

**Arthur Drummond**, son of the late Sir George Drummond, of Montreal, died on May 29 at the Royal Victoria Hospital. The deceased, who was in his 48th year, was the general manager of the Canada Sugar Refining Co. of Montreal.

**George Arthur Grier**, president of G. A. Grier & Sons, Montreal, died on Oct. 25, aged 67. Mr. Grier was also president of the Dominion Glass Co., St. Lawrence Flour Mills Co., and general director of the Dominion Textile Co.

**William Yellowley**, superintendent of the Canadian Locomotive Works, Kingston, Ont., died at his home on August 6 of heart failure, aged 57. He was a native of Newcastle, England, and had been with the locomotive works for over 15 years.

**Thomas J. Drummond**, a prominent business man of Montreal, and a member of the Drummond, McCall Co., died at his summer residence at Castine, Me., on August 6. Mr. Drummond was born at Tawley, County Leitrim, Ireland, on September 26, 1860.

**John Power**, who for 33 years was superintendent of the Montreal Gas Works, passed away in that city on October 4, at the age of 81. Mr. Power was an Irishman by birth, and came to Canada in 1860. He retired as superintendent of the gas works in 1895.

**Erastus Long**, president of the E. Long Mfg. Co., Ltd., Orillia, Ont., died on Oct. 4, aged 48. Mr. Long was one of the most prominent and public spirited citizens of Orillia. He had been chairman of the Orillia Water, Light and Power Commission since its inception four years ago.

**John D. McEachren**, a former well known manufacturer of Galt, Ont., died at Indianapolis, Ind. The late John D. McEachren was in his 81st year and was born in St. Croix, Quebec. He founded the McEachren Heating and Ventilating Co., now Sheldons, Ltd., Galt.

**Robert Maitland Roy, C.E.**, manager and director of the Hamilton Bridge Works, Hamilton, Ont., died on June 27. Deceased was born at Stirling, Ont., on November 28, 1869, and had been manager of the Hamilton Bridge Works since 1908, and a director since 1913.

**William Henry Jaques**, who did much to develop the American armor plate and ordnance industry, died at High Barnet, near London, England, on Nov. 24. Mr. Jaques was born in Philadelphia on December 24, 1848, and lived for the most of his life in the United States.

**Angus B. McColl**, founder of McColl Bros. & Co., Toronto, died early in February. The deceased was born in Kilmelfort, Argyleshire, Scotland, in 1834, and when about ten years of age came to Canada. In 1878 he founded a large lubricating oil business in Toronto, Ont.

**Arthur P. Scott**, well-known in engineering circles in Montreal, died in that city on Feb. 17, aged 39. Mr. Scott was a graduate of McGill University and for the past year had been connected with the Snider Electric Furnace Co., of Chicago, Ill.

**Sir Charles Rivers-Wilson, K.C.M.G.**, former president of the Grand Trunk Railway, died in London, England on Feb. 9. Sir Charles was born in England

in 1831, and entered the British Treasury in 1856, having a distinguished career as a financier. He was president of the G.T.R., from 1895 to 1909, retiring in favor of Charles M. Hays.

**Capt. Frank Ross Newman** died in London, England, on Oct. 23, as a result of wounds received in action in France. Capt. Newman was born in Montreal in 1879. Prior to going overseas with the 19th Battalion he was manager of the Toronto sales office of the Canadian Fairbanks-Morse Co.

**Dr. William Frederick King**, chief Astronomer of Canada and Commissioner for the Survey and Marking of International Boundaries, died on April 23, at the Observatoire Residence, Ottawa, Ont. The late Dr. King was born at Stowmarket, Suffolk, England, 62 years ago, coming to Canada with his parents eight years later.

**Sir Hay Frederick Donaldson**, who early in June was lost on H.M.S. Hampshire, was technical adviser to David Lloyd George, when Minister of Munitions. He visited Canada in the fall of 1915 on the invitation of D.A. Thomas (Lord Rhondda) to study the possibility of manufacturing heavy ordnance in this country. He was born in 1865.

**Richard Grigg**, Canadian Commissioner of Commerce, died suddenly at Ottawa on January 6. The deceased was born at Plymouth, England, in 1847, and came over to Canada when quite young. He was appointed Trade Commissioner for Canada in 1909, with headquarters at Montreal, and in 1912 was appointed Commissioner of Commerce.

**James Chase Wallace**, former president of the American Ship Building Co., died on Oct. 31, at his home in Lakewood, O., after an illness extending over several months. Mr. Wallace was born May 23, 1865, a son of the late Robert Wallace, who was one of Cleveland's pioneer ship builders. He was elected president of the company in 1904 and retired in 1914.

**Sir Hiram Maxim**, inventor of the automatic system of firearms, died in London, England, on November 24. Sir Hiram Maxim was born in Sangerville, Me., on February 5, 1840. The Maxim automatic gun was invented in 1884 in London, and was immediately adopted by the British Government. Some years later Sir Hiram was knighted by Queen Victoria after having become naturalized as an Englishman. He invented the first smokeless powder. In 1915 he was appointed a member of the Inventions Board cre-

ated by the British Government to meet the needs of war.

**David McNicoll**, formerly vice-president and general manager of the C.P.R., died on Sunday, Nov. 26, at Guelph, Ont., after a protracted period of ill-health. Mr. McNicoll retired from the C.P.R. two years ago. Mr. McNicoll was born in Arbroath, Scotland, 66 years ago, and started his railway career as a clerk in the freight traffic manager's office of the North British Railway. In 1874 he came to Canada, and entered the service of the Northern Railway of Canada at Collingwood, and served later on the Toronto, Grey and Bruce before joining the C.P.R. in 1883 as general passenger agent. He became second vice-president and general manager of the road in 1900.

### CANADA'S MINERAL PRODUCTS

AN authority on such matters is quoted as saying that of the traffic provided for all railroads in Canada in the year 1913, the mines were responsible for 38 per cent., as compared with 16 per cent. credited to products of agriculture. Similar ratios govern in other years, and from such figures it is deduced that mining is the basic industry of the Dominion. He goes further by accentuating the part mining plays in providing the first essentials in national defence. From this viewpoint the position of Canada looms to proportions of international significance. The following word picture is drawn:—

"Our coal resources are among the greatest in the world.

"Our asbestos deposits in Quebec supply most of the asbestos of commerce.

"The greatest nickel deposits in the world are located at Sudbury.

"Ontario has the largest body of high-grade talc on the continent at Madoc; the largest body of high-grade feldspar on the continent in the Richardson mine, near Verona; the greatest mica mine on the continent at Sydenham, and the greatest graphite mine at Calabogie, and a recent molybdenite find within thirty miles of Ottawa may soon outstrip all rivals.

"We also have one of the richest silver camps in the world at Cobalt, and the most promising of the younger gold camps on the continent at Porcupine. Our smelters produce more refined cobalt than all other refineries in the world put together.

"With such a magnificent heritage we would be very delinquent in our duty if we did not give the mineral industry the careful attention it deserves."

### OUR FRONT PAGE MOTTO

IN the album presented to the Kitchener Memorial Fund (British), the lines constituting our front page motto appeared as a contribution from Sir David Beatty over his boldly written signature. It has been said—with full knowledge of the many brave deeds already to his credit, that Sir David, now in chief command of our navy afloat, has perhaps excelled himself in personally adopting the quotation. The four lines are a translation of part of a hymn, the writer of which has been in his grave in Poland for nearly 300 years. The third person has been substituted for the first in our quotation—in a word, the scope is nationalized.

### THE SEASONS' GREETINGS

OPPORTUNITY is taken in this, the closing issue of the 1916 volume of CANADIAN MACHINERY and Manufacturing News to extend to our subscribers the dual Greeting of a Christmastide of Good Cheer, and of a New Year throughout whose course there will predominate good health, work in plenty, and reward commensurate with hearty performance of same. As compared with twelve months ago, the outlook is indicative of greater and more widespread industrial activity, particularly with reference to our metal-working plants. We will be called upon, however, to shoulder still heavier war burdens in the coming year—men, money and munitions, and, only through our measuring up to their most exacting requirement, will the fullest realization of the greater business prospect materialize. Peace talk, and panicky stock markets—already in evidence, are incidents that will figure more or less prominently in our New Year experiences as factors militating against fulfillment of the munitions production programme to which we are committed, their effects will, however, be nil. Thank God, we realize for what we are fighting; further, that the Shake-Hands-and-be-Friends feature of the schoolboy scrap—the substance of the meantime peace proposals, is inapplicable to a settlement. We have neither been "Too Proud to Fight," nor are we so morally stupid as to let the issue go by default on any pretext or source of suggestion, however inspired.

The year now closing has been marked by a sustained and increased recognition of the purpose and worth of our journal in the spheres of the machine tool and allied industries in Canada. All of this we appreciate, stimulating as it does to greater effort along lines already undertaken as regards their further development, and in the introduction of new features as mechanical engineering progress makes available and necessary.

### MUNITIONS PRODUCTION URGENCY AND COSTS

THE necessity for further limitations to shell profits was strongly emphasized by Mr. Flavelle, Chairman of the Imperial Munitions Board, in his speech to assembled Canadian munitions makers immediately on his return from England recently. Viewing his pronouncements in the light of a speech made a few weeks ago by the British Minister of Munitions, it is made abundantly clear that not only are more, and still more shells required and at a much accelerated rate of production, but it has been determined that within the Empire sole accomplishment is to be brought about. Canada's embrace of the opportunity, by assuming the responsibility of her share, will, we believe, be both immediate and complete. Evidence of the increased shell output requirement is to be found in the formation of a Man-Power Committee in Britain to devise ways and means whereby the productive ability of her citizens may be more effectively placed and applied, and this, notwithstanding the fact that two and a quarter million workers are already under operative control by her Ministry of Munitions. Still more workers are, however, urgently required. Why?

Quite early in the war, the departmental executive charged with the production and supply of shells for the battle front were far-seeing enough and gifted enough to not only diagnose the then serious nature of the struggle with its added certainty of being long drawn out, but to immediately prescribe for its efficient treatment. Large numbers of existing metal-working plants were at once put under Government control, and the erection of munition factories, numerous and enormous beyond the most advanced human comprehension were undertaken, completed, equipped and made productive in record time. That such action was necessary for a variety of reasons is perhaps more fully appreciated at this stage than two years or more ago, especially in view of developments—military and financial, European and American statesmanship activities, etc.

Quoting from the speech last month of Mr. Montagu, Britain's Minister of Munitions . . . "Sometimes a factory had been put up against time, regardless of cost, yet, in spite of the apparent extravagance from a peacetime standpoint, the profit realized after a few month's operation more than paid the total construction cost, allowing for the difference between making a thing oneself and buying it abroad." The foregoing quotation puts the matter of munitions production cost in a nutshell, so to speak, and defines for us here both the attitude to be adopted and the specialized effort required. The opening days of the New Year will be marked by the taking of a census of Canada's man-power, the latter being none the less vital to our part in the struggle than are the activities of the Man-Power Committee in Great Britain.

Omission—A line at the bottom right hand corner of page 730—"CONTINUED ON PAGE 293" (Advertising Section), has been inadvertently omitted.

## Dominion Bridge Co. Ltd., and Subsidiaries, Lachine, P.Q.

### Staff Article

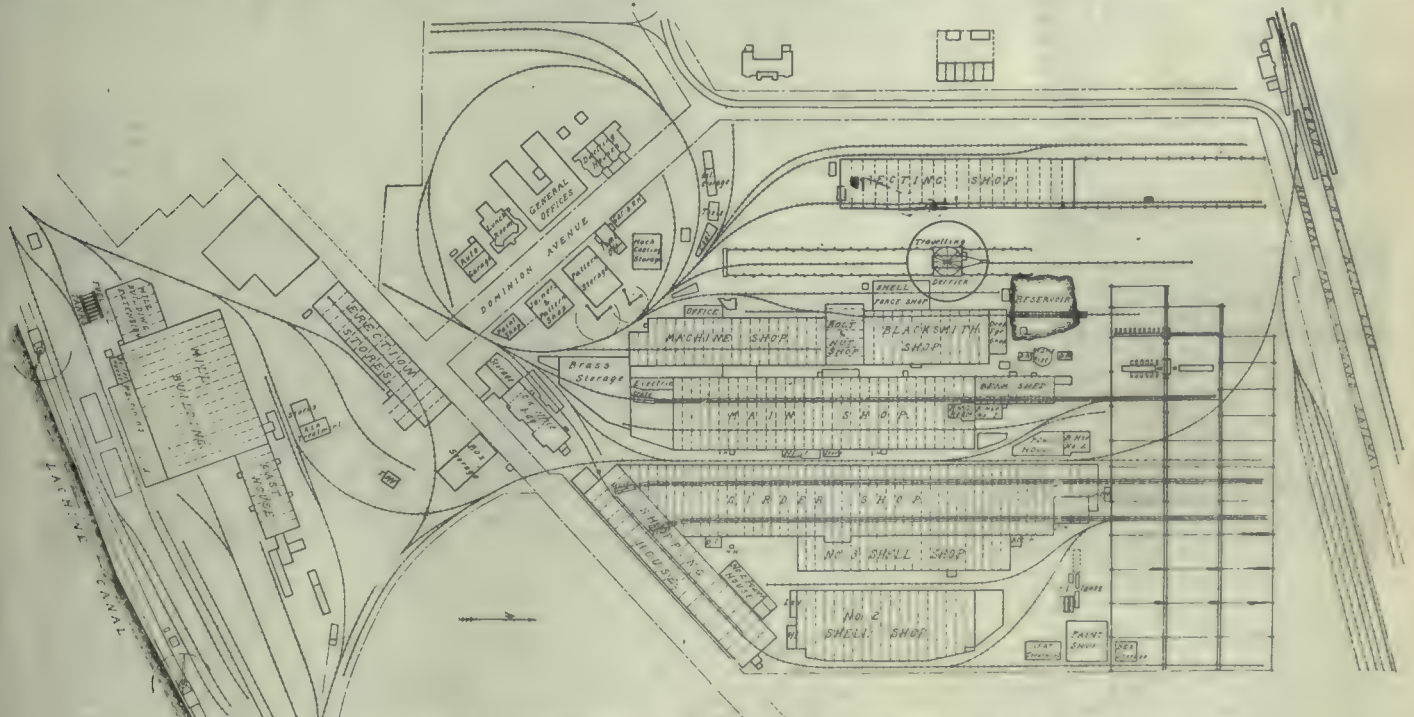

*A front-ranker on its own record among Canada's metal-working industries, the Dominion Bridge Co. can lay claim also to have been a generous contributor to our national upbuilding and development. While its creation of two subsidiary concerns—the Montreal Ammunition Co., and the Dominion Copper Products Co., may be said to be primarily a war-opportunity inspiration, it will be evident from what follows that the groundwork of an enlarged sphere of peace-time product manufacture has thereby also been established.*

#### DOMINION BRIDGE CO.

**T**HE Dominion Bridge Company, Limited, of Lachine, Province of Quebec, Canada, had its origin in a small concern located in Toronto and known as the Toronto Bridge Co., which

in. During its earliest years the company fabricated and erected numerous railway and highway bridges of various types, plate and lattice girders, pin and riveted trusses, trestles and viaducts, as well as several buildings for industrial

bridges which at that time were receiving the attention of promoters and engineers. With a capital of \$348,100, which was successfully procured, a new property was acquired in the town of Lachine, Que., about seven miles west

GROUND PLAN, SHOWING DEPARTMENT LAYOUT OF THE VARIOUS PLANTS AT LACHINE, QUE.

concern was founded in 1879 to cope with a demand for iron and steel work at that time springing up in the Dom-

purposes. In the year 1882 the owners decided to organize and equip for the manufacture of the various larger

of Montreal, and in 1883 the Dominion Bridge Company, Limited, was incorporated, the Toronto organization being

carried as a branch. The Board of Directors of the new company consisted of Job Abbott, Ira Abbott, Angus M. Thom, Luke Lyman, Phelps Johnson, James King, and J. Reid Stewart.

The first shop constructed at Lachine was 512 feet long by 120 feet wide. It was well equipped with the best class

Atlantic Railway, over the St. Lawrence River, aggregating 3,906 feet in length.

The Cape Breton Railway Bridge over the Grand Narrows, C.B., embracing six 239-foot spans, and one 242-foot swing span.

In 1888 the Toronto branch was dismantled, as it was found that the La-

development, has been most marked in the Western Provinces, has led to the establishment of branch shops and offices; those at Toronto and Winnipeg being capable of supplying most kinds of structural work and certain classes of bridge work; in fact, the Winnipeg plant as enlarged in 1912-3, is now fit-

GRAND TRUNK RAILWAY BRIDGE ACROSS ST. LAWRENCE AT COTEAU LANDING, 1910.

of machinery then available, and was accepted as one of the largest and most efficient bridge plants then existing on the continent. Shortly after incorporation, a contract was received for the St. John cantilever bridge, and when this was nearing completion, a further contract was received for the steel work in connection with the Canadian Pacific Railway Bridge over the St. Lawrence River above the Lachine Rapids. Previous to 1890 many important bridges and structural undertakings were successfully erected, a few of which are here referred to:—

#### Early Bridge Output Detail

The C.P.R. Bridge at Sault Ste. Marie, consisting of ten fixed spans of 240 feet

chine plant could successfully handle the fabrication of all the work secured. However, in 1897, the capacity of the headquarters plant was not sufficient to take care of the rapidly increasing volume of business created by the remarkable acceleration of the country's development, and further additions to the Lachine plant were therefore built, the year 1897 marking the commencement of a long period of growth and progress. From time to time other extensions have been added, until at the present time the entire plant represents one of the most modern and efficient bridge shops to be found anywhere on this continent, or elsewhere. Before the inception of war activities, the Lachine Works had a total floor space, under cover, of 458,-

ted to handle the heaviest material, with the exception of the most extreme varieties. A smaller branch is also maintained at Ottawa, having a covered area of 20,000 square feet, and capable of producing about 3,000 tons of building steel annually. Including the Lachine plant and the above-mentioned auxiliary plants, the total yearly capacity of the Dominion Bridge Company is approximately 120,000 tons. In addition to the preceding, the company owns over a half interest in the shops of the St. Lawrence Bridge Company, at Rockfield, Quebec, where the steel for the new Quebec Bridge was fabricated, and also that of the lost centre span. The new span is now in course of construction at the Rockfield plant.

GRAND TRUNK RAILWAY BRIDGE ACROSS RICHELIEU RIVER AT BELOEIL STATION, 1907.

long each, and one swing span of 405 feet.

The Fredericton Bridge on the Fredericton and St. Mary's Railway, over the St. John River, consisting of six 239-foot fixed spans, two 161-foot fixed spans, and a 242-foot swing span.

The Coteau Bridge, on the Canada

600 square feet, or about 10½ acres, which is 7½ times greater than the original shop of 1883.

#### Recent Business Development

In more recent years the growth of the company's business, which, in common with the general trend of Canadian

#### Engineering Staff Personnel

A trained and efficient staff of engineers has always been maintained, there being attached to the technical staff engineers from other countries, both European and American, the general policy always having been to keep abreast of the best practice throughout the world.

The contracts received for many of the most important structures were obtained largely through the designs submitted by the firm's own engineers in open com-

petition with those of other countries. it does, a large and exceptionally well equipped machine shop, work of almost any magnitude can be undertaken. The hydraulic lift locks at Peterborough and

many changes in the directorate since the company commenced business, included in the removal list being such well-known names as those of R. B.

FIVE-MOTOR ALTERNATING CURRENT ELECTRIC TRAVELLING CRANE, 81 FT. 3 1/4 INS., SPAN WITH TWO 35-TON TROLLEYS.

petition with those of other countries.

Special mention should be made of the engineering department of the plant at Lachine, which undertakes the design and manufacture of every description of mechanical apparatus. Possessing, as

Kirkfield, the movable dams at Sault Ste. Marie, the regulating gates at Shawinigan Falls, are among the better known structures of a mechanical engineering nature built and installed.

The flight of time has brought about

Angus, T. G. Holt, the late James Ross, the late Duncan McIntyre, and the late James P. Dawes.

#### Munitions Manufacture Feature

In common with the greater number of Canadian metal-working plants, the

END ELEVATION OF HYDRAULIC LIFT LOCK, TRENT CANAL, PETERBOROUGH, ONT.

Dominion Bridge Co. for the past two years has devoted much of its energy and enterprise to the manufacture of munitions, for which purpose many ex-

concern being found in another section of this article. The banner year of the Bridge Company was that just completed, the total business aggregating \$6,-

the works is the general office building, U shaped of three storey brick construction, with a frontage of 108 feet, and a depth of 125 feet. On the first floor

CANADA ATLANTIC RAILWAY BRIDGE ACROSS ST. LAWRENCE AT COTEAU LANDING, 1889.

tensions and several new shops have been erected and equipped. One of the most recent developments that evidence the progress made is that of the organization of the Dominion Copper Products Co., a description of which as a going

525,000, this being just \$25,000 greater than the capitalization of the company. A brief description of a few of the more important departments follows:—

#### General Offices and Laboratory

Directly facing the main entrance to

are located the main offices and those of the general executive; on the second floor are the engineering staff, draughting and accounting departments; the upper storey being reserved for the drawing room of the structural and

SIDE ELEVATION OF HYDRAULIC LIFT LOCK, TRENT CANAL, KIRKFIELD, ONT.

building departments. Since the inception of the manufacture of munitions, it has been found necessary to establish a local metallurgical department for the testing of the various materials entering therein. The laboratory, located in the basement of the main office building, is under the direction of a chief chemist, his deputy and four assistants. The laboratory is equipped with the latest and most efficient apparatus for both the physical and chemical testing of metals. Control analyses are run

and the analyses run close to 99.95 per cent. copper.

In addition to laboratory work for the Dominion Copper Products Co., this department has charge of the heat treatment of the Russian high explosive and British 18 pdr. shrapnel shells for the Dominion Bridge Co., the annealing of the brass cartridge cases for the Montreal Ammunition Co., also the tool hardening for all departments of the plant. For physical tests, a 100,000 pound Olsen machine (one of the

and 80 feet wide, and of fabricated steel and brick construction. The nature of the work covers a wide range of engineering, more especially along the lines of heavy structural equipment for mechanical purposes. In addition to the mechanical devices that form part of all bridge construction, the more important work handled by this department in recent years has been cranes and crane equipment, various types of steel dams, lift locks, etc. Operating throughout the full length

PORT OF MONTREAL FREIGHT SHEDS NOS. 24 AND 25, BUILT IN 1914.

daily on brass to see that it is kept well within the specified limitations. For this purpose a Braun electrolytic testing apparatus is used, having revolving anodes, and turning out four copper determinations every twenty minutes; a set of four being determined at one time. Efforts are made to maintain a composition of 68.5 per cent. of copper and 31.5 per cent. of zinc, with an unavoidable small proportion of such impurities as iron, arsenic, etc. The copper that comes from the refining furnace is also carefully tested

largest in Canada), has been installed. There is also a complete microphotograph equipment for the taking and developing of photos, showing the composition of various metals.

#### Machine Shop and Tool Room

Owing to the large variety of mechanical equipment being constantly manufactured by this company, it requires quite an extensive machine shop for successful accomplishment. This shop, the first large building from the entrance to the works, is 330 feet long

of the main shop and above the heavier machine tools is a 50-ton Dominion Bridge Co. crane; numerous jib cranes are also located along the walls. These latter have an approximate range of 180 degrees, and are supported at the outer ends by means of two spreading legs, the wheels on the lower end of which run on a semi-circular rail, having a radius of about 20 feet. In addition to the standard gauge track that passes down the center of the shop, a narrow gauge track is provided for light trucking. It might be here stated

SECTION OF MOVABLE STEEL DAM, SHAWINIGAN WATER AND POWER CO., SHAWINIGAN FALLS, QUE.

SPECIAL TRAVELLING AND REVOLVING DERRICK, 25 TONS CAPACITY AT 60 FT. RADIUS, AND 15 TONS CAPACITY AT 80 FT. RADIUS.

that much of the past year's activity has been due to the building of machinery for shell production and other war contingencies. During the past eighteen months, considerable equipment for the several Associated Companies has been constructed, in addition to that for the requirements of the ordinary lines of domestic business.

### Machine Tool Equipment

Among the more important machines on the lower floor are:—

**Drills**—One Bertram 5 foot radial, belt driven; two Bickford 5 foot radials, motor driven; one 20 inch Foote-Burt, belt driven;

**Boring Mills**—One 12 foot Bertram; one 6 foot Bullard; one 3 foot Bullard; one 4 foot Baush & Harris; one 4 foot Bertram; all of them vertical and motor driven; one horizontal boring machine, Bertram make, motor driven.

**tool section.** This has been largely utilized for nearly two years as a special tool room for the maintenance of tools, dies, jigs and fixtures necessary for the economic and rapid machining of the various types of shells. At first glance this section impresses one as being greatly over-crowded owing to the large number of machines in sight, but as very little floor space is required for the "product," the apparently crowded appearance is nothing more than the profitable use of every available inch of space. The principal tools in this department are:—

**Milling machines**—One Brown & Sharpe; one Cincinnati; one American; two Garvin; three Ford-Smith; and one Rockford.

**Lathes**—One 14 inch Hendey; one 14 inch P. E. Reed; one Boye and Emmes; one 14 inch Rockford; one 16 inch C.M.C.; four 14 to 18 inch Muel-

nut tapping machine, made by the National Machinery Co. are in continuous operation. Owing however, to the abnormal conditions that prevail throughout the entire plant, the greater activities of this department are at present confined to machining the lighter forgings belonging to shrapnel and high explosive shells. These pieces, which consist of 18 pdr. shrapnel diaphragms and the base plates of the high explosive shells up to 6 inch, are brought to this department from the drop forge presses, and have the fins trimmed off in an E. W. Bliss press. The shrapnel diaphragms are drilled and tapped in fourteen R. McDougall drill presses, being afterwards machined in a number of Automatic Machine Co., special lathes. The machining operations on the different base plates are also performed on the last mentioned lathes. Included in this department are a Bert-

ROLLED STEEL PLATE BRIDGE TRUCKS FOR 70-TON BRIDGE, 81 FT. 3½ INS. SPAN.

**Planers**—One 5 x 5 x 18 foot Bertram, motor driven; one 3 x 3 x 7 foot Cincinnati, belt driven; one 4 x 4 x 18 foot Bertram, belt driven; one 16 foot open side Cleveland, belt driven; one Bertram open side gang cutting planer, motor driven.

**Shapers**—One 24 inch Rockford, belt driven; one Gleason bevel gear shaper, motor driven.

**Slotters**—Three motor driven Bertram slotters, with strokes ranging from 10 to 20 inches.

**Lathes**—5 C.M.C. engine lathes 14 to 20 inch swing; 3 Bertram, 24 to 28 inch swing; one 18 inch Gardner; one 36 inch Fiffeld; one 36 inch Bertram; one 5 foot Bertram gap lathe, all of them belt driven; and one 36 inch Bertram engine lathe, motor driven.

One 12 inch Baker key seater, and one Bertram horizontal hydraulic press.

In the upper gallery extending along one side of the entire shop is the small

ler; one 14 inch Le Blond; and two 10 inch Mulliner.

**Shapers**—Three Bertram, one Walcott, and one Buttler, with strokes from 16 to 24 inches.

**Planers**—One 2 x 2 x 7 foot Bertram, and one 2 x 2 x 7 foot Gardner.

**Grinders**—One R. E. Wills & Sons; one Wilmarth & Norman; one Brown & Sharpe; and one Iroquois.

There are also three Sipp sensitive drill presses and six Racine power hack saws. In addition to the machine equipment, bench facilities are provided for a large number of die and tool makers.

### Nut and Bolt Department

Located between the machine shop and the blacksmith shop is the nut and bolt department in which all the rough bolts made in the adjoining departments are threaded and the nuts tapped. Four Landis Machine Co. double headed bolt threaders and one six spindle

ram combination punch and shear, and a Besly face grinder for removing the ragged edges from the rough forgings.

### Blacksmith Shop

North of and adjoining the nut and bolt department is situated the blacksmith shop of steel and brick construction, with a length of 210 feet and a width of 90 feet. The end nearest the bolt shop is devoted to the manufacture of nuts, bolts, and rivets, for which purpose eight to ten bolt machines are installed; each being provided with an oil burning furnace suitable to the size and nature of the work. Two horizontal type hydraulic presses are located about the center of the shop, with furnaces adjoining, for upsetting the ends of long heavy tension rods. The hammer equipment consists of one Pilkington 5 ton pneumatic hammer; one 10 ton Bertram steam hammer; one 10 ton Bertram steam hammer; and one large 25 ton plate frame

steam hammer. This last mentioned unit was designed by the staff engineer, F. C. McDonald, and constructed in the plant. In addition to four large jib

pound E. W. Bliss unit; two 1000 pound Billings & Spencer; one 1200 pound E. W. Bliss; two 600 pound Billings & Spencer; one 500 pound

installed consist of two-700 ton Southwark vertical hydraulic shell forging presses, and two-200 ton horizontal presses of same make. The billets are

CAP ROUGE VIADUCT ON NATIONAL TRANSCONTINENTAL RAILWAY NEAR QUEBEC, 1906.

cranes arranged along the center of the shop and having a range of 360 degrees, there are a number of smaller ones located at desirable positions along both of the side walls; these have a range of about 180 degrees. All cranes are provided with air hoists or chain blocks to facilitate the handling of material. Numerous small forges, anvils, etc. are distributed about this department. Since the initiation of shell manufacture, and establishment of the plant of the Dominion Copper Products Co., the blacksmith shop has been called upon to take a very active part in filling the demands made by the different departments for their various requirements.

#### Drop Forge Department

To meet the demand for the smaller forgings required in the make-up of different shells, a small steel and corrugated sheet iron addition, 75 feet by 30 feet, has been made to the north end of the old blacksmith shop. The hammer equipment consists of one 2,000

Billings & Spencer; and three 600 pound Chambersburg; all being of the board lift type, and located in two rows down the center of the shop. An oil fired furnace is provided for each. For the removal of ragged edges, a heavy Ford-Smith grinder has been installed. The present daily output of this department is approximately, 10,000 shrapnel discs, and 8,000 each of 18 pdr., 4.5 in., 60 pdr. and 6 inch H. E. shell base-plates per day.

#### Shell Forging Department

During the summer of the past year a shell forging shop has been added to the other activities of the plant, and for the past few months has been in operation on the production of 6 inch high explosive shells; further developments are under consideration. The present equipment consists of one continuous coal fired billet heating furnace about 30 feet long; two oil fired Ferguson continuous billet heating furnaces, and two smaller oil burning Mechanical Engineering Co. furnaces. The presses

received from cars at the charging end of the furnace and elevated to a platform by means of a low lift hoist. The billets are then taken and placed on an inclined runway and allowed to roll down into the fire chamber, where they are heated to the desired temperature of about 2150 degrees F. They are removed from the furnace through a door on the side, across which a number of hanging chains are placed to protect the workmen from the heat. The hot billet is supported in long tongs which are carried on overhead rails to the front of the press. The large 700 ton presses were designed to operate on four shells at a time, but for various reasons are at present only working on half this quantity. A quadruple revolving punch holder is secured to the movable ram of the press, and two dies set diametrically opposite are located in position on the base of the press. Two centering and two piercing punches are used. When two heated billets have been placed in the dies, the turret is locked in position with

the centering punches in line with the dies; the first movement of the ram making an impression about 3 inches deep and of the shape of the nose of the punch. The turret is then revolved through an angle of 90 degrees, locked in position, and the piercing completed on the two shells at the second downward stroke of the press. The capacity of each press under good working conditions is approximately one shell per minute. The shells as they come from this extrusion operation have a slight taper in the bore, and about one-half inch on the outer diameter in the length of the shell. To bring the forging to the desired diameter with parallel walls, the shells are forced through a pair of reducing dies in a 200-ton Southwark horizontal press, which is provided with a swing stripper to remove the shell from the punch as the ram returns to its former position. Under ordinary conditions, these two operations (piercing and redrawing) can be performed at one heat, but to guard against unforeseen difficulties with consequent delay, it is deemed advisable to re-heat the billet so as to avoid unnecessary stress upon the punches and dies. However,

owing to the loss through oxidation, better results are obtained when the drawing process is completed at one heat. From this method of production it is obvious that the output will be the same on both presses. The coal fired furnace takes care of one large press, while the other 700 ton press is supplied from the two smaller oil burning furnaces. The average production of 6 inch forgings at the present time is over 1,000 per day. As the accumulator is located in another building, a graduated wooden board is placed on the wall back of the press to indicate the accumulator position and the volume of water available.

#### Wood Working Shop and Pattern Storage

On the right of the main entrance to the works, is a three storey building, 65 feet by 85 feet, used for pattern storage, and constructed of steel and corrugated sheet iron. All patterns are easily accessible being arranged in serial order. A large Otis Fensom freight elevator is installed for the convenient handling of the heavier patterns. Fire precautions are amply pro-

vided for by a complete sprinkler system installation, innumerable fire buckets and several Garth fire extinguishers. Connecting the second storey with the upper floor of the adjacent pattern shop and joinery department is a closed-in bridge gallery, which offers a convenient means of communication between the two buildings. The pattern shop is a two storey brick building 60 x 60 feet, well lighted and steam heated and embodying a complete line of equipment necessary for highly efficient production. Some of the more important machines include:—

One C.M.C. planing machine.

One MacGregor, Gourlay, planing machine.

One MacGregor, Gourlay rip saw.

One J. A. Fay rip saw.

Two MacGregor, Gourlay band saws.

One C.M.C. band saw.

One MacGregor, Gourlay moulding machine.

One Oliver trimmer.

One Oliver wood turning lathe.

One C.H. Besly sand papering machine.

#### Machine Casting Storage

To the rear of the main time office,

HIGHWAY ARCH BRIDGE OVER GORGE OF ST. JOHN RIVER, NEW BRUNSWICK.

and just left of the works entrance, is the machine casting storage, a corrugated sheet iron building 60 x 48 feet. Here a complete stock of finished castings for the various machines and power equipment is always maintained, to avoid unnecessary delay in the operation of any one, or group of units in a department. The smaller parts are systematically arranged in labeled bins along the walls and down the center of the room, while the more bulky pieces are kept in order upon the floor. A 2 ton chain block and monorail are provided for facilitating the handling of the heavier castings.

#### Girder Shop

About the only department that has retained its identity—not having been materially effected by war conditions is the girder shop, where the various bridge and structural steel members are prepared and assembled. Next to the work of the designing and structural engineers who plot and prepare the plans and specifications, the successful completion of a particular engineering undertaking depends largely upon the accuracy and care exercised and displayed in this department. It has therefore been the aim of the management to provide every facility for the

trusses are so designed that the lower or horizontal member of each one acts as a runway for small travelling air

TWENTY-STOREY ROYAL BANK BUILDING, TORONTO, 1914.

hoists; two of which are often used on the one truss. Along each side of the shop, six radial jib crane drilling ma-

work to the machine. Along the center of the shop, for a distance of nearly 200 feet, is a runway that carries three travelling jib cranes, supporting heavy pneumatic riveters for operating on large fabricated material. For the lighter work, numerous smaller air operated riveters are provided; small oil burning rivet heating furnaces are located in each bay of this section. In addition to two standard railway tracks running through the shop, two narrow gauge tracks of different widths are used for the local trucking of material. Owing to the nature of the work, and the necessity of often requiring to move large members to definite positions for machining purposes, and at the same time retain their horizontal position, special roller stands are provided. Among the machines in this department are the following:—

#### Girder Shop Equipment

Two large Bertram rotary planers for facing off the ends of I beams and girders; these are driven by 30 h.p. Crocker-Wheeler, and Westinghouse motors.

A heavy I beam shear is mounted on a rotary table to aid in locating for exact position.

A row of nine heavy 6 feet radial

STANDARD TWO-MOTOR ELECTRIC TRAVELING CRANE TROLLEY OF 10 TONS CAPACITY.

rapid fulfillment of structural contracts, coincident with a high standard of strength and workmanship. This shop which runs parallel to the other main buildings, is of steel, brick and sheet iron construction, 720 feet long, with a width of 120 feet. The roof

chines are provided for drilling holes in the various members preparatory to the riveting process. These machines can be moved along the entire length of the shop, thus increasing their effectiveness, as it is often easier to bring the machine to the work than the

drills, made by Wm. Asquith of Halifax, Eng., are installed for the heavier and more accurate drilling of important holes.

For plate work, three Bertram combination punches and shears operated by 15 h.p. motors are provided.

One Cleveland and one Bertram motor driven angle iron and I beam punch.

One Newton cold saw, driven by an 8 h.p. General Electric motor, is used for general variety work.

throughout its entire length and extending into the stock yard for a distance of 300 feet. At one end of this building is a large Bertram 6-foot rotary planer, driven by a 24 horse-power Crocker-Wheeler motor. This unit is used

being obtained from outside sources, the power equipment is confined to the transforming of power from a main line of 10,000 volts to a plant voltage of 2,200 volts for the operation of the motor-generator sets and also the air compressor. Current is also transformed to 220 volts for the operation of departmental motors. Two Crocker-Wheeler motor-generator sets are installed to generate A. C. current for use in several departments. Direct current is used to operate the 375 horse-power Crocker-Wheeler motor that drives the large Canadian Ingersoll-Rand air compressor. This unit has a capacity of 2,000 cubic feet of free air per minute, compressed to a pressure of 100 lbs. per square inch and which is maintained in several receivers located in different parts of the plant. A small low pressure air compressor is provided as an auxiliary to maintain the required volume of air when the plant is working at full capacity. A fully equipped 14-panel switchboard is located at the end of the engine room. In addition to the main power house, a large boiler room containing five 100 horse-power boilers is used for heating purposes; the main shops being heated by forced hot air from a Sturtevant fan, while the other smaller shops are heated with live steam.

#### Ordnance Departments

In common with nearly all large metal working establishments, the outstanding feature of present activities is the manufacture of munitions of war for the Allied Governments. When it was definitely decided that shells were to be made in Canada, the Dominion Bridge Co. was one of the first to fall into line, and from a small beginning

#### Power Plant Equipment

Owing to the greater volume of power

For facing the edges of long plates or beams, a 30 foot motor driven Bertram plate planer is installed.

One Hilles & Jones double angle shear, driven by a 15 h.p. Westinghouse motor.

One 6 foot Bertram gap shear, driven by 15 h.p. Westinghouse motor.

One Cleveland gang punch 8 feet wide, driven by 20 h.p. Crocker-Wheeler motor; this unit is provided with a roller table on the feeding and discharging sides, the feeding side being supplied with motor driven control for advancing the work to the desired position.

One Cleveland deep-throat heavy plate punch, driven by 10 h.p. Crocker-Wheeler motor.

A Bertram gang punch operated by a 20 h.p. Westinghouse motor is provided with a special semi-automatic feeding attachment made by the Standard Bridge Tool Co. of Pittsburg.

Together with the above standard tools, an interesting machine is that constructed by the Dominion Bridge Co. for the shearing of large I beams. This unit is made largely of heavy steel plates and has an intermittent motion when cutting through a beam. It might be added that considerable auxiliary equipment of an essential nature is also provided, the non-mention of same here making them none the less important. A complete system of forced hot air heating is installed throughout this and the main building.

#### Erection Shed

Along the western side of the property is the erection shed of iron and sheet iron construction, 400 feet long by 82 feet wide, with a crane runway

for facing off the ends of large girders and fabricated members. Two 35-ton Dominion Bridge Co. cranes are in service in this department, while several traveling jib crane drilling machines are located along the walls. A section of this shop is at present used for cutting 6½-inch diameter steel bars into billet lengths for 6-inch shells. Several Hall cutting-off machines are used to cut a groove about ½ inch deep around the stock, the bar being afterwards broken into lengths by means of a heavy short-stroke bulldozer. A large Newton cold saw is also employed on this operation.

LITTLE SALMON RIVER VIADUCT ON NATIONAL TRANSCONTINENTAL RAILWAY.  
185 MILES NORTH OF MONCTON, N.B.

DROP FORGING DEPARTMENT DOMINION BRIDGE CO.

in November 1914, when the initial order for ten thousand 18 pdr. British shrapnel was received, the capacity of the plant has not only steadily developed, but has been among the foremost to set the pace for further achievement. The machine tool equipment has gradually been increased and new departments added, so that in many respects, the entire plant has, with few exceptions, practically lost its pre-war identity. A noteworthy feature in connection with the plant was the erection of No. 2 shell shop, 305 feet long by 120 feet wide, constructed of timber and sheet iron, with steel I beams.

varying but little from those already published. A brief summary covering various shell products being manufactured, with their sequence of operations will therefore be all that is here necessary:—

#### Russian 75 mm. H.E. Shell Production

The shells are received at the plant in the form of rough forgings, the latter having been made in an outside forging plant. The first machining operation is to face off the base, so that the thickness of metal is 11-16 inch; the open end is then cut off to an overall length of 10 11-16 inches. When facing off the

cold water on the outside of the tank.

After hardening, the shells are drawn back by placing them in a furnace heated to a temperature of about 800 degrees F. They are again placed in a chuck to have the bore finished to a diameter of 2.19 inches, and the counter-bore to 2.375 inches. They are again centered in the base, after which the thread R.H. Whitworth, 12 threads per inch is milled in the nose. After hand sizing the nose, the shells are washed and cleaned and the nose bushing (previously machined), screwed in. The outside is now finished, the diameter at the base—for a distance of 1.625 inches

POWER HOUSE WITH AIR COMPRESSOR IN LEFT FOREGROUND, DOMINION BRIDGE CO. PLANT.

This building was completed in about six weeks, the first machines being installed and running in less than three weeks after the turning of the first sod. The shop was used first for the manufacture of 18 pdr. high explosive shells, and reached a maximum production of 4,500 shells per day. It may be noted here, that the company have constructed a large number of the lathes that are working on the various size shells. Some conception of the plant activities may be had from the knowledge that upwards of 275 engine lathes; 60 turret lathes; 30 cutting off machines and 70 drills are in constant operation during 10 to 23 hours every day, with the exception of Sundays. As the manufacture of the smaller shells has been well covered in previous issues of this journal, a detail description will not be given, the methods now employed

base, a portion is left in the middle, in which the hole for the lathe center is made. The shell is then placed in the lathe and rough turned to a diameter 3.035 inches, the allowance above and below this size being .005 inch. The base is again faced off, removing about 1-16 inch of metal. Following this operation, the shell is placed in a collet chuck, the bore being roughed out to a diameter of 2.16 inches; the recess cut in .526 inch from the open end; the open end faced off to an outside length of 10.531 inches; and the nose chamfered and counterbored to a diameter of 2.35 inches. After the old center has been cut off, the shells are heat-treated. Five oil-fired furnaces are provided to heat the shells to a temperature of about 1,400 degrees F., after which they are quenched in oil, which is kept cool by the circulation of

being 2.95 inches; the main portion is .010 inch larger, while the section back of the profile is 2.985 inch. The base is again faced. The next operation is grooving, undercutting and knurling for the copper band, following which the base is faced off to thickness of  $\frac{1}{2}$  inch, and the corner rounded. Such operations as marking, sand blasting, polishing, etc. precede the pressing-on of the copper bands and the turning of same. After the final inspection, the shells are lacquered inside and out, nose plug finished, then crated and shipped.

#### Operations on 60 pdr. Shell

The sequence of operations on the British 60 pdr., Mark V. shell are as follows: Facing off base, and leaving tit for center. Cutting off the open end to an inside length of  $15\frac{1}{2}$  inches.

Face off and recenter base. Rough turn to a diameter of 5.045 inches, and rough off nose. Finish inside bore to a diameter of .3365 inches, with a high and low limit of .005 inch. The shells are then placed in an oil-fired furnace, and the nose heated for a distance of about four inches and the open end closed in, the overall length at this stage being  $17\frac{1}{8}$  inches. The next operation is to bore and face the nose to 1 13-16 inches diameter and an outside length of 17 inches, turn chamfer in nose, and finish inside profile. The thread in the nose is next milled to 2 inches in diameter, 14 threads per inch, R.H. Following this the outside diameter is finished to 4.960 inches, with an allowable variation of .004 inch either way; profile is also finished to a radius of 11.16 inches, back 5.19 inches from open end. The shell weight at this stage should be 51 lbs. 11 oz., with 2 oz. variation. Waving and grooving is the next operation. The base is then recessed to a diameter of 3.375 inches, leaving .575 inch thickness of metal. The hole for the fixing screw is now drilled and tapped. After such operations as hand sizing of nose, sand blasting, preliminary inspection, etc., the next machining operation is to insert and rivet in the base plate, and saw off the driving square, following which the base is faced off and the corner rounded. After inspection and sundry operations, the copper rifling bands are pressed on and turned. The shells are then marked, varnished, etc., and finally crated in readiness for shipping. Practically the same process is followed on the 4.5 inch and also on the 6 inch high explosive shells.

#### Operations on 8 Inch H. E. Shells

The machining of the larger shells, 8 inch, varies somewhat from that on the smaller sizes. The interior of the shell nose is first rough drilled to in-

sure accurate work on the subsequent operations. The hole in the nose is next rough-drilled to a diameter of 1 1-16 inches, and the end faced, leaving a depth of metal of about 2.125 inches. This operation is accomplished

operation is boring out the base and cutting to length, the diameter for the thread being 5.278 inches, counter bore 6 inches with a tolerance of .003 inch either way; the overall length being 23.02 inches. Two Lees-Bradner machines are used to mill the threads in the base, these being eight per inch and left hand. For grooving, waving and undercutting, three Dombrico lathes, fitted with special attachment, are used. After preliminary inspection, cleaning, etc., the adapters are applied and faced off on the base, and the corner rounded. Following hand sizing of nose and weighing, the copper bands are heated to a dull red in an electric furnace and pressed on in a West banding machine; the shells being afterwards placed in a Dombrico lathe for finishing of the bands. After varnishing the inside, and sorting series, the shells are given a final inspection, following which they are greased and crated. The approximate production on the 8 inch shells is about 240 per day. Following is a tabulated statement of the production of the various size and type shells, cases, discs, and rough copper up to and including November 20, 1916:—

#### Shells.

15 pdr. Shrapnel, British	26,227
18 pdr. Shrapnel, British	721,900
18 pdr. High Explosive, British	527,207
4.5 in. High Explosive, British	418,912
60 pdr. High Explosive, British	60,514
6 in. High Explosive, British	35,198
8 in. High Explosive, British	720
75 mm. High Explosive, Russian	87,550

#### Brass Cartridge Cases.

on two C.M.C. 5 foot radial drills. Several Hall cutting off machines are used to cut off the open end, the overall length being 23.35 inches. The outside diameter is then roughed off to 8.07 inches and the profile roughed; this operation being done on a number of Advance-Rumley heavy duty lathes. The succeeding operation, that of boring, is performed on several Dombrico lathes; the finished diameter being 5.258 inches, with a high and low tolerance of .0075 inch. The nose is now bored, faced and tapped, the process and dimensions being similar to that on the smaller shells. Five Yeates lathes operate on the finish turn and profile, the outside diameter being 7.958 inches, with high and low limit not exceeding .0075 inch. The next

In addition to the large volume of business handled by rail and water, considerable local trucking is done between the plant and the City of Montreal, which is about  $7\frac{1}{2}$  miles away. There being no foundry in connection with the plant at Lachine, castings are obtained from outside firms, and for this purpose four 5-ton trucks are maintained in constant service. A one-storey fireproof brick garage, 50 feet by 48 feet, with accommodation for eight or ten cars (including trucks), is located close to the main office and works entrance.

### MONTREAL AMMUNITION

**D**URING the year 1915 the Montreal Ammunition Co., which is a subsidiary of the Dominion Bridge Co., was organized for the purpose of manufacturing brass cartridge cases for 18 pdr. and 4.5-inch high explosive shells. The greater portion of what was formerly the main shop of the Dominion Bridge Co. is now utilized for this purpose. Since the inauguration of this undertaking, the facilities for production have gradually been increased; improved methods have been adopted; new equipment has been installed; workmen have become more expert in the operation of machines, until the efficiency of the plant may be said to have almost reached its maximum. The present output of the plant is approximately twenty thousand 18 pdr. and 4.5-inch cases a day. A brief

description of the process followed in the production of the 18 pdr. cases follows:—

#### Cartridge Case Production

The brass discs for the cases are supplied by the Dominion Copper Products

Co. The brass discs for the cases are supplied by the Dominion Copper Products Co. The capacity of each furnace is

EQUIPMENT LAYOUT NOS. 2 AND 3 SHELL SHOPS. DOMINION BRIDGE CO. PLANT.

Co., their manufacture being described in another section of this article. The first operation after the discs are received is that of cupping, which is performed on several Ferracute presses. Under ordinary conditions, the press operates continuously, a cup being formed at each stroke of the press, the product passing completely through the die. A copious supply of lubricant is automatically distributed to the punch and die by the vertical action of the ram. The drawn cup has an inside diameter of 3.99 inches and an outside diameter of 4.544 inches, with a depth of  $2\frac{1}{4}$  inches. In order that satisfactory results may be obtained on all subsequent operations, it is essential that the semi-fin-

ished cases should be thoroughly annealed between each drawing operation to restore the ductility of the metal. Four Quigley, and one Rockwell continuous, oil fired furnaces are used for this purpose. The capacity of each furnace is six loaded trays, the trays, about 5 ft. square, being pushed into the furnace by means of a long ram operated by compressed air. At intervals of six minutes, the doors at either end, which are controlled simultaneously, are opened, and, as the ram moves forward, the trays are all advanced; the one at the discharging end having attained a temperature of 1,220 degrees F., passing on to a specially constructed roller platform, which is immediately lowered into the cooling bath. Following the cooling of the cases, they are placed in wooden crates and pickled in a weak solution of sulphuric acid. They are afterwards dipped in a caustic soda bath and then washed in warm water to remove all trace of acid.

#### First to Fourth Operations

The first and second re-drawing operations are practically the same, but with different reductions. In all instances, the cases are forced through the dies, falling out below. The dimensions after the first draw are 3.962 inches inside and 4.275 inches outside diameter, with a length of  $3\frac{1}{8}$  inches; second draw dimensions are 3.912 inside and 4.121 inches outside diameter, with a length of  $4\frac{1}{4}$  inches. Crank operated Ferracute presses are used on preliminary drawing. Before going to the third annealing (which is identical in all cases), the partly finished product is given its first indent in the head. The cases are placed on a tilting post, the impression being made when the fixture is in a vertical position. The press operates continuously, an indent being made at every stroke. The cases are again annealed and given the third draw, following which the diameters are 3.984 inches outside, and 3.843 inches inside, the length being roughly  $5\frac{1}{4}$  inches. The fourth draw is similar to the preceding

BALING SCRAP IN A LONGEMANN "CABBAGE" MACHINE, MONTREAL AMMUNITION CO. PLANT.

ones, being accomplished in a vertical press, but owing to the increasing length, the operations require a little longer time, and consequently more presses are necessary. This reduction increases the length to  $7\frac{1}{2}$  inches, with an outside diameter of 3.855 inches and a tapering bore, the wall thickness being 0.042 inch at the mouth and 0.077 inch near the head end. Before being again annealed, the cases are given the final indent, and a small hole drilled through the centre to permit of the free passage of air as the case is drawn on and off the punch.

#### Fifth and Final Operations

Owing to the increasing length of the cases, the drawing for the fifth and sixth reductions are performed on variable stroke presses; several Bliss vertical presses operated by rack and pinion, and a number of horizontal double ended Ferracute screw presses being employed. The dimensions after the fifth draw show an approximate length of  $9\frac{1}{4}$  in., an outside diameter of 3.776 in., and a tapering bore, the diameter at the mouth being 3.725 inches. After the cases are trimmed to a length of 9 inches, they receive their last annealing and are then taken to the final draw, which is performed in the horizontal presses, the dimensions after drawing being  $12\frac{1}{2}$  inches long, an outside diameter of 3.7315 inches and an inside diameter of 3.680 inches at the mouth, tapering to 3.635 inches near the head end. The cases are again trimmed to a length of  $11\frac{3}{4}$  inches, following which they are headed in two operations, that of flattening and final heading. A revolving turret is secured to the lower or movable ram, with an enclosed spring and roller bearing to facilitate operation.

Up to this point, the case has been practically parallel, but in order that it will fit the breach of the gun for which it is intended, it must have a taper of 0.04066 inch per inch throughout its entire length, with the exception of an inch at the mouth, which is left parallel. To successfully accomplish this operation, it is necessary to anneal the mouth of the case half way down. For this purpose a special furnace has been built, in which a number of cases are placed, each one resting on a revolving post, thus assuring uniform heating and annealing to avoid buckling of the case when being tapered in the die. The complete tapering is done in two operations, the first closing the upper end for about six or seven inches, the next bringing it to the desired shape and dimensions, the parallel portion at the mouth being 3.34 inches diameter. The machining of the head and mouth is performed on a number of Bullard, and

C.M.C. special lathes, after which the cases are inspected and rectified in another department. The operations on the 4.5 in. shell cases are almost identical to those on the 18 pdr. shell cases, one less draw being required. For a de-

#### DOMINION COPPER PRODUCTS

**T**O overcome the difficulties that confronted munition manufacturers at a time when great annoyance was being experienced in securing delivery on component parts of shells, more espe-

MAIN SHOP, DOMINION COPPER PRODUCTS CO. PLANT.

tailed description of these, readers are referred to our August 24 issue.

For the maintenance of the numerous gauges, the accuracy of which is one of the most essential factors in the manufacture of shells and cases, this plant has provided a special gauge-making department, where the final operations are performed on the various gauging tools, and also the readjustment of the numerous gauges that are used throughout the entire works. To obtain the greatest efficiency of the limit system and assure the highest standard of checking of all limit gauges, a master set of Johansen gauges is provided.

cially copper bands and brass discs for cartridge cases, steps were taken by H. H. Vaughan, president of the Montreal Ammunition Co., to undertake the production, on a large scale, of these most essential accessories. The Dominion Copper Products Co. was, therefore, incorporated on November 5, 1916, supplementary Letters Patent, dated July 31, 1916, being issued, and additional supplementary Letters Patent now being applied for. The company is capitalized at \$3,500,000, and its operation is distinct from that of the parent concern, its defined purpose being to refine, cast, roll and otherwise work and manufacture

FILLING BILLET MOLDS FROM COPPER REFINING FURNACE, DOMINION COPPER PRODUCTS CO. PLANT.

copper and brass products and the alloys thereof.

### Seamless Copper Turning Production

After ceaseless labor and untiring energy on the part of Mr. Vaughan and his engineer, Ferdinand Deming, a seamless tube expert, the plant of the Dominion Copper Products Co., was established on an operating basis, and with the extensive additions now projected, it promises to become an important and permanent factor in our coming peace-time industrial development. The ultimate intention of the company is to manufacture all kinds of copper and brass metal products, the extensions and equipment now under consideration having for their object the rolling and drawing of all kinds of sheets, strips, rods, tubes, etc.

Activities are meantime confined to the production of seamless copper tubing for the rifling bands of shells from 3 ins. to 12 ins. in diameter; also the brass discs for the British 3.3 ins. and 4.5 ins. cartridge cases, and the Russian 3 in. cases. Owing to the fact that this undertaking was launched at a time when definite delivery on equipment was practically impossible, it fell to the lot of the management to, not only design but construct the bulk of the machinery necessary for the successful operation of the plant. The three large tube drawing presses as well as many of the lesser tools and much of the general equipment are expressive of what has been thus accomplished. The plant is located on the north shore of the Lachine Canal, and on property previously occupied as a stock yard by the Dominion Bridge Co. The main

mill building has a width of 180 feet and a length of 240 feet. The extensive additions now under construction will when completed, greatly enhance the meantime production capacity. The

weighed and the proper proportion of each placed in oblong sheet steel trays, one of which holds the charge for each crucible. For the weighing of these metals, two Fairbanks floor scales have

SPECIAL OIL-FIRED TILTING FURNACE FOR SMELTING INGOT COPPER. DOMINION COPPER PRODUCTS CO. PLANT.

various departments are so arranged that the handling of the product is reduced to the minimum, the material progressing through the different operations, from the raw ingot to the finished article.

### Casting the Brass Slabs

Before the cast ingots are delivered to the casting room, they are carefully

been installed. Arranged along each side of the shop are forty crucible pit furnaces, and back of these are the bins that hold the coke and charcoal used in firing the furnaces. Midway on each side and extending the full length on one side and over half the length on the other, are the slab moulds into which the molten metal is poured. These moulds, of which there are 120 in the shop, are made of special cast iron and always remain in a vertical position: the front portion being hinged at the lower end and secured in place by means of clamps and lugs which form part of the complete mould.

The molten metal is strained through  $\frac{3}{8}$  in. holes in the bottom of the runner boxes which are also hinged to the upper section of the mould. After the metal has solidified, the slabs are removed and the mould cleaned with a wire brush, and otherwise prepared for the following cast. To facilitate the pouring of the hot metal, eight jib cranes having a range of 360 degrees are installed. The slabs as they come from the moulds are 6 $\frac{3}{4}$  inches wide and 1 $\frac{1}{2}$  inches thick, with a length of about 40 inches. Owing however, to the pipe that forms at the top of the slab, it is necessary to cut away some of the metal at this point. This is accomplished in a large 20 inch alligator shear, made by the Canton Foundry & Machine Co. Pieces about an inch wide are cut off until the end of the

VIEW OF CAST HOUSE, SHOWING ROW OF SLAB MOLDS, DOMINION COPPER PRODUCTS CO. PLANT.

slab shows no sign of pipes or other defects. The scrap from the punch presses is received in this department and cut into small pieces by the alligator shear.

#### Rolling Out the Brass Strips

After the pipe has been cut off, the slabs are taken to the breaking down rolls which are 22 inches in diameter and operate at 16 turns per minute. Both this mill and the finishing mill were built by the Waterbury Foundry

.875 inch. The strips are next annealed by heating them in a large Quigley furnace for about an hour and a half, the final temperature being about 1,320 degrees F. The brass strips are placed upon large open steel trays that are carried about on steel trucks. These trucks are backed up to the furnace door, and the loaded trays drawn into the fire chamber by means of long rods and cables, the latter being wound around a drum which is operated by a

A short stroke bulldozer driven by a 5 h.p. motor is used for this purpose.

From the scalping machines, the strips are again taken to the roughing rolls, where they receive four further reductions, the dimensions after each pass being approximately .710 in., .640 in., .530 in., and .500 in. They are again annealed, also pickled and cleaned, then taken to the finishing rolls and given two passes, the thickness reductions being respectively .420 in. and

1—JONES & LAMSON TURRET LATHES OPERATING ON 18-PDR. SHRAPNEL—D.B. CO. 2—PRESS DEPARTMENT FOR 18-PDR. AND 4.5 IN. SHELL CARTRIDGE CASES—M.A. CO. 3—INTERIOR VIEW OF ERECTION SHED SHOWING STEEL IN COURSE OF CONSTRUCTION FOR OFFICE BUILDING FOR THE MADRAS & SOUTHERN MAHRATTA RAILWAY, INDIA—D.B. CO. 4 AND 5—NO. 2 SHELL SHOP ERECTED COMPLETE IN LESS THAN SIX WEEKS, AND WHICH WAS PRODUCING 18-PDR. H. B. SHELLS IN THREE WEEKS AFTER FIRST SOD WAS TURNED.

small motor located conveniently.

#### Scalping Operations

From the furnace the strips are plunged into a cooling bath, following which they pass to the scalping machines where the surface is scraped off. Four Torrington, and two Waterbury-Farrell units are used, on this operation; these machines having a stroke of about 12 in., and a lateral feed of about 1/2 inch. Before scalping, it is sometimes necessary to strengthen the strips owing to the curl left from the rolling operation.

.380 in., the last being the thickness of the finished disc.

Before blanking out, the strips are annealed and pickled, being afterwards taken to the presses to have the discs punched out; the diameter being 6.22 inches. Two heavy presses are used on this operation, one Hilles & Jones, and one Bertram. These two machines turn out about 23,000 discs per day when operating at full capacity. The discs are weighed in quantities on a Toledo dial scale and must average 3 1/2 pounds apiece. Crating for delivery to

& Machine Co., the former being driven by a 200 h.p. and the latter by a 150 h.p. Crocker-Wheeler motor. It might be mentioned here that other units of a like nature are at present under construction in the plant of the Dominion Bridge works. The first breaking down operation consists of four passes through the rolls, starting off with about a 20 per cent. reduction in cross sectional area; this amount becoming less at each pass. The various thicknesses after each pass are approximately 1.250 in., 1.075 in., .925 in., and

the case-making departments of the different plants follows:

#### Copper Bands for Large Shells

Three methods are at present employed for the production of the various

tubes for the 8 inch bands and larger are drawn on the 300 ton press, and the punches and dies are required to be changed for each size. All tubes are annealed and pickled between each drawing operation. The semi-finished

of scrap that naturally accumulates about a plant of this description, a reverberatory refining furnace has been installed, in which all the scrap copper from the plant and elsewhere is melted and refined by the regular poling process. Immediately in front of the furnace tap hole, a structural steel revolving device is located that will hold 12 ingot moulds. These moulds are provided with trunnions upon which they can be revolved when dumping out the ingot. Semi-circular perforated water pipes are located above and below the moulds for cooling purposes. When pouring, a continuous stream is allowed to flow from the furnace into an auxiliary ladle directly beneath the tap hole. This ladle is then tilted as each mould is brought into position, a small quantity of sulphate being mixed with the metal as it flows from the ladle.

Another method of obtaining these ingots is by means of a special high pressure oil burning Rockwell tilting furnace, in which the pure copper ingots are melted and poured into billets. The blast for this furnace is supplied by a Connellsville Blower, driven by a 10 h.p. Westinghouse motor. The cast billets are afterwards placed in the double chamber furnace shown and heated to a temperature of about 1750 degrees F., and drawn into a shell in the 1200 ton Southwark extrusion press. The billets have a diameter of 9 inches and a length of 10 inches, with a round base.

FINISHING ROLLS, DOMINION COPPER PRODUCTS CO. PLANT.

sizes of copper bands; casting into tubes and drawing for the smaller sizes; casting into ingots and drawing for the intermediate sizes; and cupping from the flat sheet and drawing for the larger sizes. The plates for the latter process are received at the plant in octagonal shape of one inch thickness, and after a  $1\frac{1}{2}$  inch hole has been punched in the center, they are cut to a round disc 48 inches in diameter on a Lennox heavy circular slitting shear driven by a 5 h.p. Westinghouse motor. This machine is fitted with a jib crane secured to the frame and with a  $\frac{1}{2}$  ton triplex chain block. After the disc has been annealed and pickled, it is cupped in the large 300 ton horizontal tube drawing press; the flat plate being rigidly held by the hydraulic blank holder which is operated by the two smaller cylinders shown above and below the central die. The center hole is located on the pilot pin while the metal is being shaped in the die.

The diameter of the cup is about 29 inches, and the succeeding draws reduce the cup to tubes having diameters that are approximately 24, 20, 16, 12, 9.2, and 8 ins., or roughly speaking a reduction of cross sectional area of from 25 to 20%. As there are two weights for the 9.2 ins. shell bands, the tubes for the lighter ones are used to draw those for the 8 inch bands, as the reduction can be obtained at one operation. If the heavier tube is used it necessitates two reductions to obtain the desired size. These various reductions are performed in series, as the

tubes are placed upon steel trays and drawn into the furnaces, being allowed to heat to a temperature of about 1,350 degrees F., after which they are removed and immersed in a cooling bath and then pickled. A fair average output on this press is about one draw per minute. The power for the three large

DRAWING COPPER SHELLS FROM CAST BILLETS, DOMINION COPPER PRODUCTS CO. PLANT.

hydraulic drawing presses is derived from a large accumulator, the latter being supplied by three Deane pumps, each driven by a 200 horse-power Crocker-Wheeler motor.

#### Tubes from Solid Billets

In order to utilize the large quantity

After extrusion, the length is approximately 18 inches, with a central hole of 6 inches diameter; the outer diameter remaining the same. After these shells have been annealed and pickled, they are drawn down to the desired sizes on the 125-ton horizontal press. The fuel oil used throughout the plant is stored

in seven large tanks located between the main building and the canal. From these tanks the oil is forced to the various furnaces by means of two small electrically-driven geared pumps.

Small Tubes from Cast Cylinders

The tubes, from which are produced the 4.5 ins. and 3 ins. bands, are first cast in cylindrical moulds having a de-

Lunch Room

Owing to the semi-isolated location of the plant and the large number of employees both in the offices and works, ample provision has been made in the immediate vicinity for the comforts of the innerman. Adjacent to the main office is a one storey frame building used as a lunch room for the office staff and workmen. In addition to this, the company

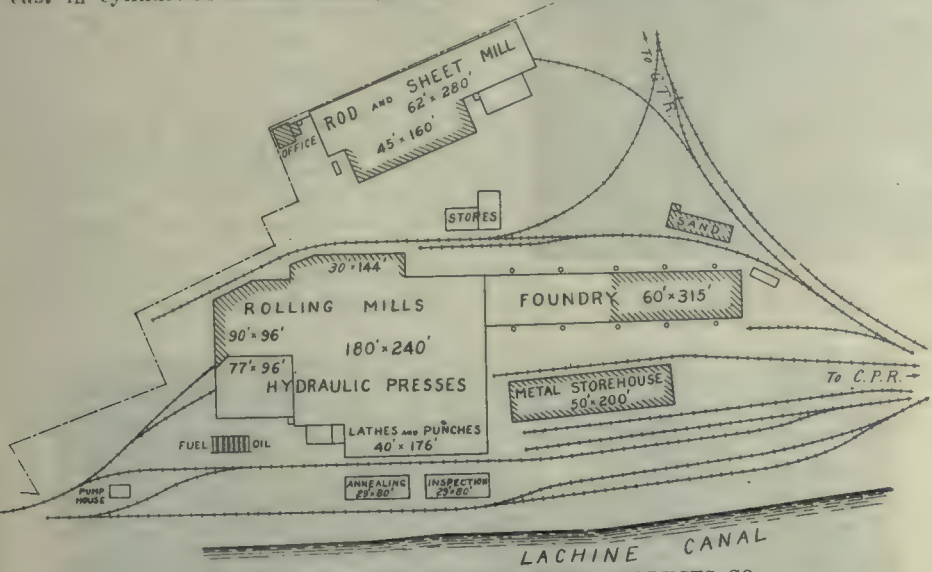

ing one 1,000-gallon Worthington Underwriter fire pump. One of these pumps can draw its supply either direct from the standpipe or the reservoir. The other pump draws water from a well fed by gravity from the large reservoir, and also by the mill supply pump at the canal bank pump house. With the exception of the shell forge shop, which is of fireproof construction, the erecting shop and a few isolated sheds, all buildings of the plant are equipped with automatic sprinklers. Throughout the yard, numerous hydrants and hose houses are located, together with two hose reel houses, the latter being close to the works offices and directly facing the main office building. An efficient fire brigade, composed of workmen in the plant, is maintained. fire practices being regularly held. A system of signals has been adopted to indicate the location of departmental fires.

Miscellaneous Data and Equipment

To more easily handle the constantly accumulating copper and brass scrap, a Longemann cabbage machine is installed, the scrap being pressed into blocks 6 inches square and 12 inches long, under a hydraulic pressure of 2,000 lbs. per square inch. Several large Fairbanks track scales are installed in different parts of the various shops for the weighing of large fabricated material and car contents.

Running along the northern portion of the property is the stock and storage yard, having a total area of over 1½ acres. This section is traversed by three 90-foot span Dominion Bridge Co. cranes, the run of each being 660 feet. Between the erection shed and the blacksmith shop is a special travelling and revolving derrick operating along 500 feet of 44-foot track; this crane has a capacity of 25 tons at 60-foot radius and 15 tons at 80-foot radius. In order to reclaim the brass that unavoidably drops about the floor of the cast house when pouring the molten metal, the ashes and cinders about the moulds are subjected to a screening process, which separates the heavy particles of brass from the bulk of the other material.

Owing to the scarcity of labor that prevailed at the time the plant was put into operation, the securing of help was a vital problem, its solution therefore by the management is of more or less interest, inasmuch as something over 10 per cent. of the present employees are Iroquois Indians obtained from the Caughnawaga Reservation, just across the St. Lawrence River from Lachine. That the "experiment" has been successful is shown by the fact that many of these original North Americans are employed in responsible positions, such as casters, rollers, yard foremen, etc. In addition to the Indians, many nationalities are represented throughout the various departments. The number

PLANT LAYOUT, DOMINION COPPER PRODUCTS CO.  
Shaded Portions Show New Additions Recently Built or Under Construction.

structible core, the center being made of a perforated iron pipe upon which is wound a layer of damp straw, this again being covered with about an inch of loam, placed while the pipe is being revolved. It is then trimmed off parallel by means of a long straight blade, being afterwards baked in a steam heated oven and finally sand papered smooth. When the tubes have been cast they are taken to the main shop where the end is swaged cone-shape in a Bradley trip hammer to allow the punches to force the tube through the reducing dies. These sizes are finished on the 75 ton press. Before the tubes pass to the copper band department the round end of the larger and the ragged end of the smaller tubes are cut off in a circular saw. The tubes are next cut off into copper bands of desired width in eight cutting-off machines, fitted with special roller steady rests and chucks. Other equipment consists of three Automatic Machine Co. cutting-off machines and seven Bullard semi-automatic lathes for finishing copper bands. The dimensions of the rough copper bands are given in accompanying table:

control the Dombrio Hotel on a nearby street, the seating capacity of the two places being about 500.

Fire Protection

To guard against the possibility of fire, the plant is amply protected by two electrically-driven direct-connected Lea-Courtney, 750-gallon, two-stage Underwriter fire pumps. These are located in a pump house on the canal bank, and draw water from the latter, the maximum lift being about 14 feet in the spring, when the canal is emptied for cleaning, inspection and repair, and about 3 feet at all other periods of the year. The main discharge pipe from the pumps branches off into two smaller lines, one 8-inch pipe leading to the plant of the Dominion Copper Products Co., the other 8-inch line carrying the water to the Dominion Bridge Co. plant. A connection is provided for filling a 300,000-gallon capacity reservoir located just north of the blacksmith shop. Alongside this reservoir is a large standpipe, 28 feet in diameter and 89 feet high, of 408,000 gallons capacity. Close to the foot of the standpipe are two pump houses, one on either side, each contain-

of men at present employed is about 700. While the war demands are at present sufficient to keep the plants operating to capacity, the possibilities are that the post-war activities of the Dominion Copper Products Co. will mark a new and important departure in our metal-working industrial progress. The personnel of the executive is as follows:—G. H. Duggan, president; H. H. Vaughan, vice-president and general manager; F. W. Evans, secy-treas.; Ferdinand Deming, consulting eng.; G. L. Willard, general superintendent.

#### Welfare Work

Welfare work at the different plants described may be said to embrace well heated, lighted, and ventilated workshops; reading, recreation, dining and wash rooms; evening commercial and technical instruction during the winter months; first aid to the injured, accident investigation and possibility pre-

ROW OF TORRINGTON SCALPING MACHINES, DOMINION COPPER PRODUCTS CO. PLANT.

vention, etc. An ambulance corps, under the direction of executive officers of

the company and a committee of employees, not only render first aid when an accident occurs, but in serious cases requiring prompt hospital accommodation and treatment, continue their services, by personal attendance aboard the ambulance, until the former have been secured.

Each department is equipped with a stretcher, blanket and cover, while Red Cross ambulance boxes are located convenient to water, the boxes being furnished with absorbent cotton, sterilized pads, gauze bandages, scissors, splints of various kinds, etc., all ready for service. The ambulance room is furnished with leather couch, operating table, medicine cabinet (fully equipped, including instruments), small glass top table, electric heater and stand, electric sterilizer, disinfecting pans, etc. A daily record slip, giving full particulars of all

CUTTING OUT BRASS DISCS FOR CARTRIDGE CASES, DOMINION COPPER PRODUCTS CO. PLANT.

accidents which may have occurred, is filed for reference should occasion arise.

In addition to the Ambulance Corps Executive Committee, there is also an Accident Investigation and Prevention Committee, composed of the superintendent as chairman, general foreman, twenty representative foremen, and the head timekeeper as secretary. The operations of this body are constantly in evidence, the twofold duty of preventing the recurrence of a particular accident, and the elimination of both real and apparently possible risks, furnishing unlimited scope for its activities.

Thus far, the pulp and paper industry in Canada has been limited to the provinces of Ontario, Quebec, New Brunswick, Nova Scotia and British Columbia. Now, however, the beginning of a large development in the prairie province is foreshadowed by the announcement that a pulp and paper mill is to be erected in Manitoba, at a point 250 miles northwest of Winnipeg.

# Development of Ocean Service Shipbuilding in Canada--I.

By "Artificer"

*In addition to the widespread requisitioning of vessels for transportation purposes by the Allies, the war attendant and normal merchant ship losses and the many months' almost complete cessation of new construction on the part of the latter, the merchant marine of neutral countries has had the misfortune to become to a large extent the target for enemy submarine activity. Norway, perhaps more than any other nation, has suffered in this respect, hence the almost feverish anxiety being displayed by her shipping fraternity to have the losses made good at the earliest possible moment. In recent weeks many contracts have been placed on Norwegian account, with Canadian shipbuilders. The vessel features of one such follow.*

## NORWEGIAN FREIGHTERS BUILDING AT TORONTO

THE construction of two steel cargo steamers by the Polson Iron Works, Toronto for Christoffer Hannevig of Christiania, Norway marks a new development of the shipbuilding industry in the Queen City. Steel freighters are also being built on the Pacific Coast for Norwegian owners, from all of which it is evident that still more important developments may be expected in shipbuilding in Canada on not only her ocean shores but on those of her Great Lakes as well. The

two freighters which have recently been laid down at Polson's shipyard, give indication of being but the first of a series of orders for vessels for foreign owners, as the shortage of tonnage has rendered imperative the building of new ships to replace those sunk during the past two years. There is every evidence that all our Canadian shipyards will participate to a generous extent both in quantity and variety of the new construction.

### New Freighter Features

The new vessels will be of standard

construction for ocean service, and will be able to navigate the St. Lawrence Canals to the sea only when in ballast, as the mean draught will be 19 ft. 6 in. when carrying a total deadweight of 3500 tons. The principal dimensions are as follows:—Length over all, 261 feet; length between perpendiculars 251 feet; beam moulded, 43 ft. 6 ins.; and depth moulded 22 ft. 11½ ins. The vessels are to be built of steel to class highest class Bureau Veritas for ocean service. They will have a flat plate keel and the framing is to be especially stiffened forward of the collision bulkhead. The

SINGLE SCREW STANDARD FREIGHTERS OF 3,500 TONS DEADWEIGHT UNDER CONSTRUCTION BY THE POLSON IRON WORKS, TORONTO, FOR NORWEGIAN OWNERS.

tank top plating is to be of steel  $\frac{1}{2}$  in. thick under the engines and boilers.

They will be of the single deck type, built on the deep frame principle, with cellular double bottom right fore and aft. They will have peak tanks and four watertight bulkheads. The poop bridge, and T. G. forecastle will be 7 ft. 6 ins. in height from top to top of beams. Each ship will have two wooden pole masts and four large cargo derricks with a winch to each. There will be two forward cargo hatches 18 ft. by 28 ft., and two aft. cargo hatches 18 ft. by 26 ft.

The stern post will be of cast steel  $8\frac{1}{4}$  in. by  $5\frac{3}{4}$  in. with rudder frame of the single plate type, the coupled stocks being  $7\frac{1}{2}$  in. diameter. The deep frame system with auxiliary side frames will constitute the basic constructional features of the hull fabrication. Intermediate angle frame stiffeners will be installed in fore peak from about one foot below light draught line to about one foot above full load draught line. Water ballast will be carried in the double bottom and fore and aft peaks, all necessary connections leading to and from the engine room and being under control there. The shell plating is to be overlapped at the edges and to have overlapped scarfed butts. Bow plates between light and load draught lines are to be thickened about 25 per cent. as provision against ice, tapering to normal thickness at from 20 ft. to 30 ft. sternwards. The keel, double bottom floors, and frames are to be machine riveted. The main poop and bridge decks will be steel, and the forecastle deck of pine.

#### Deck Machinery

For handling cargo, there will be six 7 in. by 10 in. horizontal double cylinder steam winches of Clarke-Chapman type, one at each mast and derrick. The winches will have central barrels and drums and will be placed on girders above the deck. Each mast will carry one pitch pine, 3 ton derrick, the latter to be long enough to land cargo 10 ft. away from ship's side. The windlass will be of direct acting type for operation by hand, as well as by steam, and will be complete with reversing gear. A hand screw steering gear will be installed aft, and a steam steering gear amidships. The total bunker capacity will be about 350 tons.

Suitable accommodation for the officers and crew is provided, the sailors and firemen's quarters being aft, and those of the officers on the bridge deck. Two lifeboats and one dinghy, will be carried by each ship, other equipment and fittings being in accordance with the classification requirements.

#### Main Engines

The propelling machinery will be constructed to Bureau Veritas requirements for a working pressure of 180 pounds. The main engines will be of inverted direct acting, surface condensing, triple expansion type, the cylinders being  $20\frac{1}{2}$  ins. x 33 ins. x 54 ins. diameter by 36 ins. stroke. The condenser and pumps will be independent of the main engine structure. The H.P. and I.P. cylinders will be served by piston valves and the L.P. cylinder by a double ported slide valve. All these valves will be on the fore and aft centre line of the engine. The H.P. cylinder, steam chest and steam pipes are to be tested to 270 pounds cold water pressure. The bed plate will be cast iron of box section, as will also be the columns. All shafting will be of best open hearth forged steel. The crank shaft of forged steel will be of built-up type, with cast steel crank arms. The connecting rods, crossheads and piston rods will be of open-hearth, forged steel. The valve gear will be of "Stephenson" link motion type, with direct acting steam reversing gear. The propellers will be four bladed of cast iron.

#### Machinery Auxiliary Equipment

The pumping equipment will include deck pumps for each hold; vertical duplex, brass-fitted, main boiler feed pump; duplicate of the main boiler feed pump for use as a general service donkey pump; duplex horizontal piston type bilge pump; a 7 ins., duplex, brass-fitted, ballast pump; and a fresh water pump,  $4\frac{1}{2}$  ins. x 4 ins. x 5 ins. of duplex type; air pump and a centrifugal circulating pump for main condenser. The feed water heater will be of multi-coil type installed in the feed pump discharge line. One  $7\frac{1}{2}$  k.w. Enberg electric generating set will be installed in the engine room for the ship's lighting system. An evaporator of 15 tons capacity will also be installed in the engine room.

#### Boilers

The boiler installation will consist of two 14 ft. diameter by 12 ft. long, single-ended, Scotch marine type units, arranged for natural draft only, and built to pass Bureau Veritas requirements for 180 pounds working steam pressure. Each boiler will have three corrugated steel furnaces of 42 ins. inside diameter. The tubes will be  $3\frac{1}{2}$  ins. diameter, lap welded and standard gauge. There will be a separate combustion chamber for each furnace, and one double funnel to each ship.

The keels for both steamers have already been laid and launching in

each case is expected in April 1917. The steam trials of six hours duration will take place on Lake Ontario.

#### LACHINE CANAL TRAFFIC

UP to the end of November, 24,581,371 bushels of grain passed through the Lachine Canal, just 16,082,728 bushels less than passed through in the same period last year. For November alone the amount of grain which passed through was 2,176,257 bushels, less than half of the amount for November, 1915, which was 4,978,811 bushels. Produce also showed a decrease, and the net tonnage operated was less than in the previous November. The surprising thing, however is that the cargo tonnage was greater last month by 29,368 tons than a year ago. The explanation of this lies mainly in the fact that the amount of coal carried last month was 120,548 tons, and only 98,826 tons in November, 1915.

Comparing November, 1915 and 1916, every grain showed a marked decrease, even oats and barley, which had shown increases in previous months, taking the down grade at last. The amounts, in bushels, are as follows:—Wheat, 1,439,364, decrease, 1,234,008; corn, nothing, decrease, 80,000; oats, 688,393, decrease, 1,431,836; barley, 48,500, decrease, 39,402; and flaxseed, nothing, decrease, 17,308.

In produce there are decreases in every item, as witness the following totals for last month:—Flour, nothing, decrease, 47,000 bags; eggs, 22, decrease, 29 cases; butter, 50, decrease, 95 packages; cheese, 15,458, decrease, 1,719 boxes; and apples, 3,852, decrease, 4,135 barrels.

The number of trips made through the canal last month was 750, a decrease of 84 from the same month in 1915. The tonnage operated was 386,174, a decrease of 39,027 net tons. There were 402 passengers in boats, which passed through the canal, or down the rapids, 77 more than a year before. The cargo tonnage was 350,908, against 321,540 tons in November, 1915. The number of trips light was 272, and the fact that this was 1,022 less than for the same month in 1915 is one reason why a smaller net tonnage carried more cargo even though fewer total trips were made.

**Port of Montreal.**—The St. Lawrence, owing to its situation, is the natural route from the Atlantic to the northern and north-western half of the North American continent. The possibility of converting Montreal into a deep-water seaport was first suggested in the year 1825, when the Lachine Canal was completed, connecting Montreal with the Great Lakes, and establishing the route commercially.

# 60 Million Gallon Drifting Sand Filtration Plant City of Toronto Ont.

## Staff Article

*A plant of the nature here described and illustrated embodies in its make-up and result accomplishment features of interest alike for the mechanic and private citizen, no matter their community or national location; the necessity for pure water, either for consumption alone or as a food constituent being generally recognized as a public health essential.*

THE new mechanical filtration plant at Toronto Island, which has been under construction since the fall of 1914, is now practically completed, and some filtered water is already being delivered to the city. An additional supply of pure water for the city of Toronto became imperative owing to the

tario, some form of filtration is necessary. After considerable investigation the city authorities decided that for the new plant mechanical filtration was more suited to local conditions than the slow sand system. Specifications and plans were accordingly prepared under the supervision of Works Commissioner Har-

England and Toronto, as engineers, and William Cowlin & Son (Canada), Ltd., of Bristol, England, and Toronto, as contractors, was accepted for a Ransome mechanical type drifting sand filter, with a capacity of 60,000,000 Imperial gallons per 24 hours, and at a contract price of \$1,066,282.

UPPER VIEW SHOWS LONGITUDINAL SECTION THROUGH PLANT, AND LOWER VIEW A SECTION THROUGH SINGLE FILTER.

rapid increase in population, the slow sand plant installed being altogether too small for the requirements. Owing to the condition of the water in Lake On-

ris, and tenders on same were received in January, 1914. In June of the same year the tender submitted by the John ver Mehr Engineering Co., of London,

When the city of Toronto contemplated installing an additional filtration plant, the John ver Mehr Engineering Co. solicited consideration of their sys-

tem. The request being granted, the company proceeded to erect a demonstration plant on Ellis avenue, West Toronto, for the purpose of proving the efficiency of their system and its suitability to local conditions. The plant was constructed during the spring of 1913 and turned over to the city for the official test on May 21. This continued until June 27, 1913, operation being closely watched for a period of one year. The results of the test were highly satisfactory, and were the subject of a report issued by Drs. Geo. G. Nasmith and Fred. Adams, of the Department of Public Health, Toronto. The plant at the Island was designed by the John ver Mehr Engineering Co., of which William Gore, M.Inst. C.E., is the consulting engineer, and William Storrie, A.M.Inst.C.E., the chief engineer. It is the largest drifting sand filtration plant yet installed and the largest filter plant of any type in the British Empire. The construction and operation features have aroused considerable interest among en-

they have supplied portable units for use at the various Allied battle fronts.

#### Drifting Sand System of Filtration

The plant as already stated has a con-

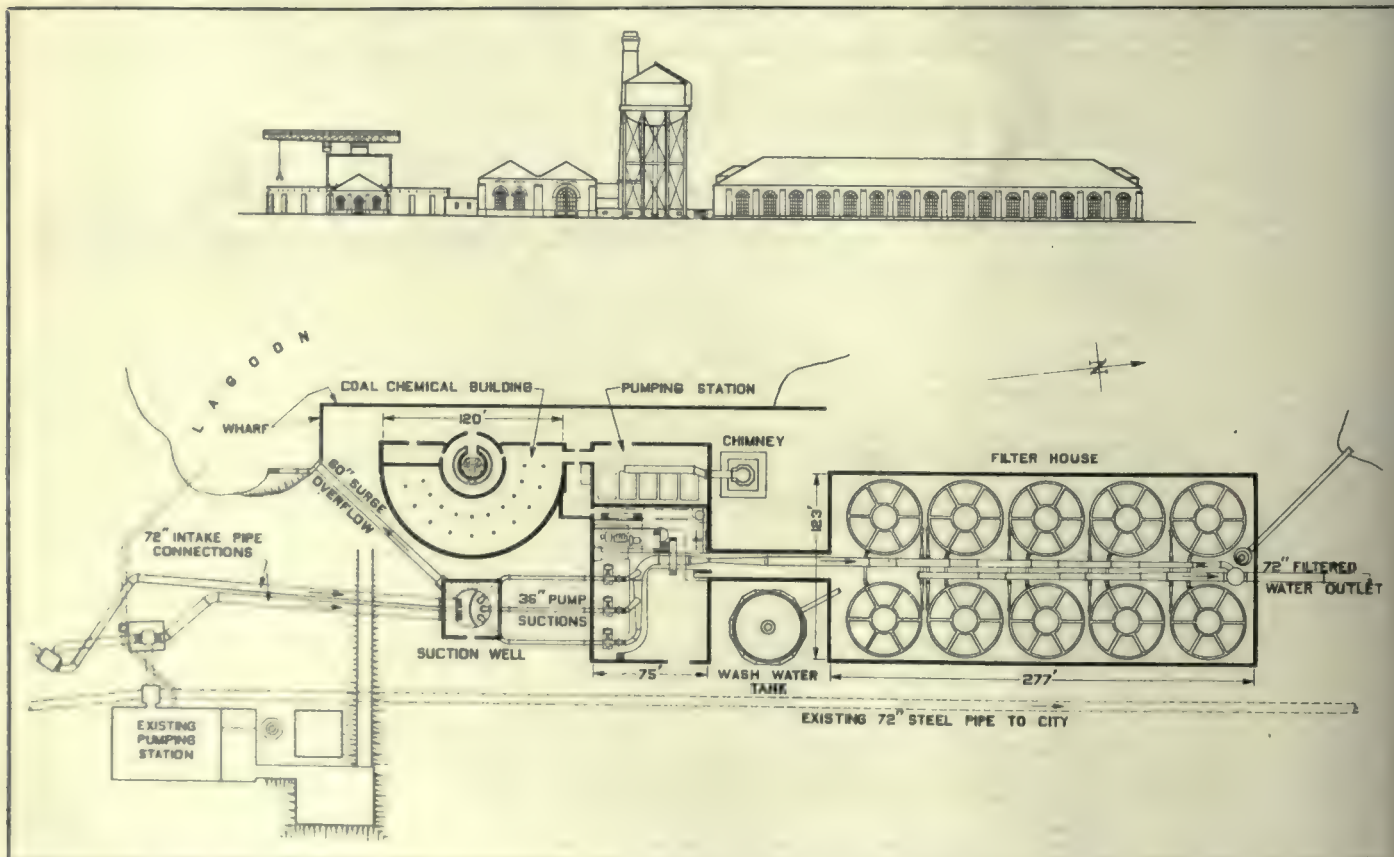

tering material, which is done without using large settling tanks and coagulating basins. The coagulant, sulphate of alumina, is introduced in the raw water in the suction well. This water is then pumped to the filters. The sand bed in the filters is composed of fine sand 9 feet deep, laid on a bed of gravel, 9 ins. deep. The action of the influent causes the upper part of the sand bed to drift across the water being filtered, the bulk of the impurities being swept out, together with a part of the drifting sand, the latter being washed and returned to the bed by the circulation of the water. The lower portion of the sand bed which remains stationary removes the remaining impurities in the water. The stationary sand bed is washed by reversing the flow of filtered water at long intervals.

SAND WASHER UNDERNEATH EACH FILTER. THERE BEING 30 SAND WASHERS TO EACH UNIT.

tract capacity of 60,000,000 Imperial gallons in 24 hours, but must be able to operate at a rate of 72,000,000 Imperial gallons for 10 hours. An important feature of the drifting sand system is its

The raw water enters the filter through a standpipe (see cross section of filter), in the centre of the unit, after passing through a sand washer at the bottom, and delivers above the sand at the top

by an inductor. The dirty water passes upward and out at the top of the washer. The sand extractors are of such form that the sand is kept out of the piping system except when the inductor is in full operation. Within the sand washer the raw water pipe is in the form of a venturi tube, and the drifting sand collected and washed in the washer is inducted into the raw water at the throat of the venturi tube. This sand passes up the standpipe with the water and is delivered, with it, above the top of the sand bed, forming a cone which continuously drifts away and is continuously being replaced. Under the gravel bed is the filtered water collecting system.

#### Plant Layout

The area occupied by the entire plant is nearly  $2\frac{1}{2}$  acres. At the lake end of the plant is the suction well, connected to chambers near the lake by two 72-in. diameter steel pipes, through which the water flows by gravity to the well. To the west is the coal and chemical store, a concrete structure located near the wharf so that the materials coming over on scows can be handled with facility. Next, to the north, is the boiler house, with the pumping station adjoining. A chimney is built to the north of the boiler house, and the wash water tank is situated between the pumping station and filter house. The chimney was built by the Custodis Canadian Chimney Co., Toronto, and is 122 feet high above boiler grate bars, and 7 ft. inside diameter at the top. It is constructed of buff pressed brick outside, and "Custodis" perforated radial brick inside, with a firebrick lining 40 feet up. The wash

Its bottom is 60 feet above the ground and 45 feet above the top of the filters. The filter house is on the north side of the plant and is connected to the pumping station by a tunnel in which is also a 72-in. venturi meter.

The sand for the filters was obtained from pits on the mainland. The sand was taken in cars to the sidings at the foot of Spadina avenue and towed across on scows to the Island, being afterwards

and machine shops. Philip J. Duff has been resident engineer in charge of the plant since the work started. Considerable care had to be exercised and special precautions adopted when excavating and building the foundations owing to the water-logged condition of the land. The buildings, with the exception of the coal and chemical storage, have reinforced concrete foundations, with concrete substructures carried up to a height of one foot below the finished ground level. The superstructures of the buildings are of buff pressed brick, and on the steel frame work forming the roof is placed boarding with red Spanish tile on top. The window frames are of pressed steel sash, fitted with wire glass. The floor and substructure of the filter house are built in sections with joints to allow for expansion or contraction.

#### Suction Well

The suction well building is 40 ft. square and the suction well is 24 ft. diameter and 25 ft. deep. The water comes from the lake into two chambers near the lake front and flows by gravity through two 72-in. diameter steel pipes, one from each chamber to the suction well. At the end of each pipe in the well is a 72-in. hydraulically operated gate valve supplied by Glenfield & Kennedy, Kilmarnock, Scotland. The valves are operated at a pressure of 700 lbs. per sq. inch from hydraulic pumps and accumulator located in the pumping station. The valves open the full 6 ft. in  $2\frac{1}{2}$  minutes. The suction well is used as a screen chamber from which the water is taken by three 36-in. pipes to the

INTERIOR VIEW OF PUMPING STATION, SHOWING THREE 36-MILLION GALLON "DE LAVAL" PUMPS.

prepared at the site. All coal required is taken over the same way. During the construction of the plant the contractors had their own carpenters, blacksmiths,

pumps. There are six sets, being 3 screens to each set, of fine mesh copper in duplicate, so that one set can be taken out for cleaning while the other set is in

operation. The suction well has a surge overflow in the event of any sudden failure of the Hydro power. There is a Builders' Iron Foundry indicating instrument for indicating the water elevation at all periods. The building is steam

WILLIAM STORRIE, A.M. INST. C.E.,  
Chief Engineer and Director, John ver Mehr  
Engineering Co.

heated and there is also a 1-ton crane provided for lifting the screens. The coagulant is introduced to the water in the well, coming through duplicate pipes from the chemical building.

#### Chemical and Coal Storage

The building comprising the chemical and coal storage is constructed of rein-

forced concrete. The chemical building is circular, being 40 feet diameter, the upper part carrying a horizontal 4-ton crane with 60 ft. reach for unloading scows at the wharf. The coal storage is built around the chemical buildings except at the front, which is straight. The coal storage has a capacity of 1,500 tons. The chemical building will hold about 800 tons of sulphate of alumina or alum, as it is more generally called. Around the storage bin are a number of doors through which the alum is fed down to a tray at mid-level in the dissolving channel maintained full of water. The solution is fed from this channel into a dilution tank in which it is automatically diluted down to the standard 5 per cent. by an arrangement similar to a hydrometer. From the tank the solution is fed into a measuring tank controlled by the 72-in. venturi raw water meter in the pumping station through a combined electric and hydraulic relay. From the bottom of the measuring tank the solution gravitates through lead pipes to the suction well and is there distributed throughout the raw water.

In this apparatus, which is in duplicate, the annular dissolving channel tank is kept full of filtered water by a float valve. From the water tank the water flows freely to the dissolving tank and, after dissolving, the alum passes through a valve at the top of the hydrometer. At the same time the water also comes from the water tank to a valve at the bottom of the hydrometer. The hydrometer is poised in the solution between the two valves. Any vertical movement of the hydrometer opens one valve and closes the other. Thus it will let in strong solutions at the top and water at the bot-

tom until the balance is obtained, at which the hydrometer just floats in a solution containing 5 per cent. of aluminum sulphate.

#### Filter House and Filters

The filter house is 277 ft. long by 123

WILLIAM GORE, M. INST. C.E.,  
Consulting and Civil Engineer to John  
ver Mehr Engineering Co.

ft. wide. It contains ten steel filter tanks, arranged in two rows, each tank being 50 feet diameter and 14 ft. deep. Between the two rows are the mains for the raw water, filtered water, and waste water. These mains are connected with each filter by cast iron pipes equipped with hydraulically operated gate valves.

The operating gallery extends the full length of the building in the centre and at the same level as the top of the filters. The gallery has stairways at each end. On the gallery are ten operating tables, five on each side, or one for each filter. The tables are made of Cecilian marble and have on the top handwheels for operating the small valves under the table, which work the hydraulically operated gate valves that control the filters. In connection with each handwheel there is a gauge for indicating the amount of opening of each valve. Behind the table are situated a loss-of-head gauge, and a venturi water meter, registering the amount of filtered water. On the west side of the space between the two rows of filters is the 72-inch raw water pipe while on the other side is a corresponding pipe for filtered water, delivering into the inspection tank at the end of the building. Above these pipes are situated two 36-in. cast iron pipes, one above the other. The lower pipe takes water after backwashing from the overflow gutters of the filters, while the upper pipe is for back wash water and is connected to the wash water tank. There are, in this building, 50 Glenfield & Kennedy hydraulically operated valves ranging from 6 ins. to 24 in. diameter.

#### Filter Tanks

The filter tanks are constructed of steel plate supported by cast iron columns. In the centre of each tank is a space 16 feet 8 in. in diameter, in which is located a 16 in. diameter by-pass with a relief valve. At the top of the filter are arranged gutters for carrying off the wash water during the cleaning operation. Each tank contains about 600 cubic yards of sand and has 30 sand cones or units with a 6 in. standpipe up the centre of each cone. For about 3 feet above the bottom of the tank these units

are separated by spaces formed with steel plates and containing the extractors. On the bottom of the tank is the filtered water underdrain system consisting of 1½ in. perforated sherardized pipes laid on concrete and connected to

around the pipe at the angle of repose. The surface of the stationary sand collects the deposit in the water as it passes through to the underdrain system.

When in operation, the coagulated raw water passes from the raw water main

INTERIOR VIEW OF PUMPING STATION, SHOWING AUXILIARY PUMPING UNITS AND SWITCHBOARD PLATFORM.

a collector. Gravel 9 in. deep is placed on the pipes in three layers, each a different grade. The filter sand is placed on top of the gravel to a depth of 9 feet. When the filters are operating, the stationary sand cones have a slope of 60 degrees and the drifting sand cones 30 degrees to the horizontal. The cones are formed by the action of the water and drifting sand passing down through the extractors to the sand washer and up to the standpipe, the sand being deposited

and enters the filter partly through the sand washer and up the standpipe or through the by-pass controlled by a relief valve. From the top of the filter it passes in turn through the drifting sand, stationary sand and gravel, to the collecting system, where it flows away through the filtered water main to the inspection tank. During this time the drifting sand is passing down the extractors and through the small pipes to the sand washer where it is cleaned and is again forced up the standpipe to the filter. This process is continuous.

About every ten days, according to the condition of the raw water, the filters have to be cleaned or back washed. The backwashing is done with filtered water from the wash water tank, which also gives the required head. The backwash water passes from a 36 in. main through the underdrain system and up through the gravel and filter bed, overflowing into the gutters where it is carried away through a 36-inch drain pipe to the lagoon. The valves during this operation are operated very slowly so that the gravel and sand bed are not disturbed. The dirty water from the sand washer is carried away in a small pipe connected to the waste pipe.

#### Pumping Station—Boiler House

A reserve steam plant is installed, and in connection with it are four boilers for supplying steam to the turbo-generator set in the pumping station and also for the steam heating system.

INSIDE VIEW OF FILTER UNIT BEFORE GRAVEL OR SAND HAVE BEEN PLACED IN POSITION.

The boiler house and pumping house are in one building but are separated by a brick division wall. The entire building is 142 ft. by 75 ft., the boiler house part being 75 ft. long by 40 ft. wide. The latter contains four 300 horse power, Scotch, marine type, dry back boilers built by the International Engineering Works, Amherst, N.S. They are each 11 ft. 8 ins. mean diameter, and contain 2,200 square feet of heating surface. Each boiler has two Morrison corrugated furnaces of 50 ins. inside diameter. To the rear end of each corrugated furnace are riveted three plain courses aggregating 7 ft., making a total length of furnace and flue of about 15 ft. In each course is placed a Galloway tube making six of these tubes to a boiler. These Galloway tubes are an interesting feature, tending as they do to improve materially the circulation. Each boiler has 142 tubes of  $3\frac{1}{2}$  inches diameter and spaced  $4\frac{3}{4}$  inches between centres; also a manhole on the top of shell and one on the front head below the furnace. MacDonald shaking grates are fitted, and furnace doors are of balanced type.

In the main flue leading to the chimney is located a balanced damper controlled by a Ford damper regulator. Each boiler is equipped with the following accessories:—One 8 in. main stop valve with by-pass; two ball and lever safety valves set for 150 lbs. working pressure; also two spring type safety valves; one 12 in. steam pressure gauge; two sets of large size

water gauges; one feed check valve; one blow off valve and one blow off cock. In connection with the steam heating system there are two reducing valves, the final reduced pressure being two pounds. All the piping and fittings

from header to the pumping station is 6 ins. diameter.

The boiler feed pump was supplied by the Smart-Turner Co., Hamilton, Ont. It is a 10-6-12 ins., duplex, outside packed unit fitted with pot valves.

VIEW LOOKING ALONG FILTER GALLERY.

are extra heavy. The boilers, piping, valves, breeching, etc., will be covered with 85 per cent. magnesia, the latter being covered with 12 ozs. canvas, all supplied by the Philip Carey Co., Toronto. The breeching to smoke stack was built and installed by the International Engineering Works. A 12 in. steam header extends over all four boilers and is 50 feet long. The steam line

There is also installed in the boiler house a 1000 horse power Cochrane feed water heater which takes the returns from the heating system, steam pumps and steam lines. A Bawden vacuum pump in connection with the heating system is also installed in the boiler house.

#### Pump House

The pumping station is 75 feet by 102 feet, and contains the three main

INTERIOR VIEW OF PUMPING STATION, SHOWING MAIN PUMPING UNITS, GENERATOR SET, AND SWITCHBOARD.

pumps, a steam turbo-generator set, switchboard, wash-water tank pumps, and pumps for hydraulic valve operating system. Ample space has been provided for installing equipment for other purposes in connection with water supply of the Island and City. The interior of the building is of buff brick with white glazed brick around the walls to a height of 4 ft. 6 ins. above floor line.

All the large pumps are situated along the South side of the building at a lower level than the main floor, while at the West end is a platform 5 ft. 6 ins. above the main floor, around the turbo-generator set. At the rear is the switchboard gallery, 3 ft. 6 ins. above the platform. The switchboard gallery is L shaped and contains at one end the main switchboard for the mechanical filter plant and a table from which hydraulic gate valves on the main pumps are operated. At the other end of the gallery is a venturi meter recorder for recording the flow in the 72 in. pipe and also a wash water tank level indicator. In the gallery, space has been allowed for additional switch boards, one for controlling the machinery for existing slow sand plant, and another also in connection with the old plant. These switchboards have not been installed at present but will be at a later date. Below the gallery are the transformers, wash water pumps, accumulator pumps, and drainage pumps. The pumping station has two bays, over each of which is a 12 ton Hepburn hand operated traveling crane. A covered passage connects the pumping station with the filter house. The 72 inch raw water main from pumps to the filters runs through this passage and has a 72 inch venturi meter in the line.

#### Filtration Pumps and Motors

Three 36 inch pumps are installed for pumping the raw water from the suction well to the filters, each pump having a capacity of 36 million gallons per 24 hours against a total head of 32 feet. They are of the De Laval type, direct connected by means of a flexible coupling to a Canadian Westinghouse 325 horse power, induction motor running at 360 r.p.m. The motors use hydro current of 2200 volts, 3 phase, 25 cycles. The pumps were supplied through and installed by the Turbine Equipment Co., Toronto. They are single stage, double suction centrifugal units with a guaranteed efficiency of not less than 77 per cent. The impellers are of bronze and renewable, the case and impeller rings being also of bronze. The hammered steel shaft is protected from the action of the water by bronze sleeves, and the pump casings are split on the horizontal centre line. Priming is secured by a 3 inch Penberthy ejection

tor. Each pump is equipped with a check valve and gate valve on the discharge side. The 36 in. gate valves were supplied by Glenfield & Kennedy, Kilmarnock, Scotland, and are hydraulically operated from a control on the switchboard gallery. The discharge pipes from the pumps are connected to a main which increases in diameter

DETAIL OF SAND WASHER.

from 36 in. to 72 in., the large end being connected to the main leading to the filter house.

#### Turbo-Generator Set

The pump motors are operated by hydro power, and during peak load, or in the event of the power failing, the steam turbo-generator set has been installed as a reserve. This unit is of the De Laval type and was supplied

through and installed by the Turbine Equipment Co. The steam turbine is an 1800 horse power impulse type machine, having one velocity and twelve pressure stages. It is direct connected, through double helical reduction gears to a 1335 k.v.a. Lancashire dynamo of 2200 volts, 3 phase, 25 cycles, slow speed, revolving field type, with a d.c. exciter on the main shaft. The turbine operates at a speed of 3600 r.p.m., the generator at 500 r.p.m., the gear ratio being 7.2 to 1; the gear bearings are of the three pinion type. The initial steam pressure on the turbine throttle is 135 lbs. per sq. inch, and the exhaust is into a vacuum of  $1\frac{1}{2}$  ins. Hg. absolute. The guaranteed steam consumption is under 18 pounds per k.w.h. Under the turbine is installed a Wheeler low level type jet condenser with centrifugal condensing water and an entrainment centrifugal air pump. Both pumps are direct connected to a 45 horse power Lancashire a.c. motor.

The turbine is fitted with a Jahns governor acting from a pilot valve that admits steam to a piston controlling the governor valve, the latter being a balanced double-seated unit. The steam admission is controlled by throttling. There is also an emergency governor consisting of a Schutte & Koerting trip and throttle valve which trips at about 10 per cent. above normal speed and stops the machine. The main steam pipe to the turbine is 6 ins. diameter and the exhaust to condenser, is 36 in. diameter. This unit is equipped with an oiling system. A rotary pump connected to the governor spindle pumps oil from a small collecting reservoir to an overhead Burt cooling tank. The oil returns through a filter under a pressure of 5 lbs. per sq. inch to the turbine and pinion bearings, and also to the manifold containing nine nozzles which supply oil to the gear and pinions. The oil is next carried by brass piping to a small reservoir, and after being strained is pumped back to the overhead tank. The turbine and pinion bearing are water cooled, and the gear and alternator bearings are of ring oiling type. A 6 in. Cochrane steam separator is installed in the line from boiler header to turbine, and is drained into a Squires trap.

#### Auxiliary Pumping Units

In the pumping station under the switchboard gallery are located various auxiliary pumping units, while there is also a De Laval booster pump situated near the main pumps. This booster pump has a capacity of two million Imperial gallons per 24 hours and is intended to be used when only a comparatively small volume of water is required for the filters or other purposes. It

delivers into the raw water main and against the same head, viz. 32 feet, as the 36 in. pumps. It is also of the same general design as the large pumps and is direct connected to a 20 horse power Canadian Westinghouse alternating currents.

The equipment under the switchboard gallery consists of two wash-water pumping units, two hydraulic pumping units and two drainage pumps, the extra set in each case being a reserve unit. Each wash-water unit pumps water up to the wash-water tank for back washing the filters, and consists of a 5 in. De Laval centrifugal pump having a capacity of 350 Imperial gallons per

motor, each of the latter being a  $7\frac{1}{2}$  horse power, 550 volts, 3 phase, 25 cycle machine, automatically controlled by Cutler-Hammer switches and relays. The drainage well or sump is located under the switchboard gallery. The bottom of the well is the lowest point in the plant and so collects the drainage from any part. The well is 9 ft. diameter and 15 ft. deep, and is cared for by two vertical De Laval 6 in. centrifugal single stage pumps. Each pump has a capacity of 700 Imperial gallons per minute against a total head of 20 feet, and is direct connected to a 7 horse power Canadian Westinghouse vertical a.c. motor. The motors are

seventh panel is connected to the three 50 k.w. transformers, the range being 2200—550 volts for the small motors. The eighth panel controls the two 25 k.w. lighting transformers, 2200—220—110 volts; the ninth controls the 20 h.p. booster pump motor; the tenth, the 45 h.p. condenser pump motor, and the eleventh, the two  $7\frac{1}{2}$  h.p. sump pump motors both fed from the one switch and controlled by the Cutler-Hammer auto starters. The two 20 h.p. wash-water pump motors are controlled from panels twelve and thirteen, while the fourteenth panel controls the two  $7\frac{1}{2}$  h.p. motors with one Cutler-Hammer auto starter and double throw knife

BOILER ROOM SHOWING BATTERY OF FOUR MARINE TYPE, TWO-FURNACE DRY BACK BOILERS.

minute against a head of 180 feet. It is direct connected to a 20 horse power Canadian Westinghouse, a.c. motor running at 1415 r.p.m. There are two of these units, each pump being equipped with a by-pass so that water can be obtained from various sources of supply.

The hydraulic pumps operate in connection with an accumulator and supply a pressure of 700 lbs. per square inch for operating the hydraulic gear on the various gate valves in the plant. These pumps are of Glenfield & Kennedy, vertical triplex type, driven through worm gearing by a Lancashire

motor, each of the latter being a  $7\frac{1}{2}$  horse power, 550 volts, 3 phase, 25 cycle machine, automatically controlled by Cutler-Hammer self starters.

#### Switchboard and Transformers

The main switchboard was supplied and installed by the Canadian Westinghouse Co. It is made of blue Vermont marble, of standard construction, and has 15 panels. It is 25 ft. 4 ins. long, and 7 ft. 6 ins. high. The first panel belongs to the exciter; the second controls the turbo-generator; the third is for the incoming line from the Hydro system, while the fourth, fifth and sixth panels control the three 325 horse power main pump motors. The

switch for operating the hydraulic pumps. The last panel is blank being reserved for future equipment.

At the left hand side of the switchboard is a swinging bracket with a volt meter, 150 scale for the d.c. exciter, a volt meter with a 3000 volt scale for the a.c. generator and a synroscope. On the incoming line panel there is a graphic recording wattmeter and an integrating meter on the generator panel. On the generator panel there are also two ammeters, a.c. and d.c.; a frequency meter and an indicating wattmeter. On the incoming line panel there is an ammeter and a power factor

meter. On each panel there are the usual operating handles for the oil switches and a pair of relays, the general layout being arranged to use hydro current or the power generated at

and two 25 k.w. transformers for the lighting system which is 3 wire, 220-110 volts. All motor connections are made in lead-covered triple conductor cable.

AXIAL SECTION, SHOWING GENERAL ARRANGEMENT OF "DE LAVAL" 1800 HORSEPOWER, IMPULSE TYPE, MULTI-STAGE STEAM TURBINES.

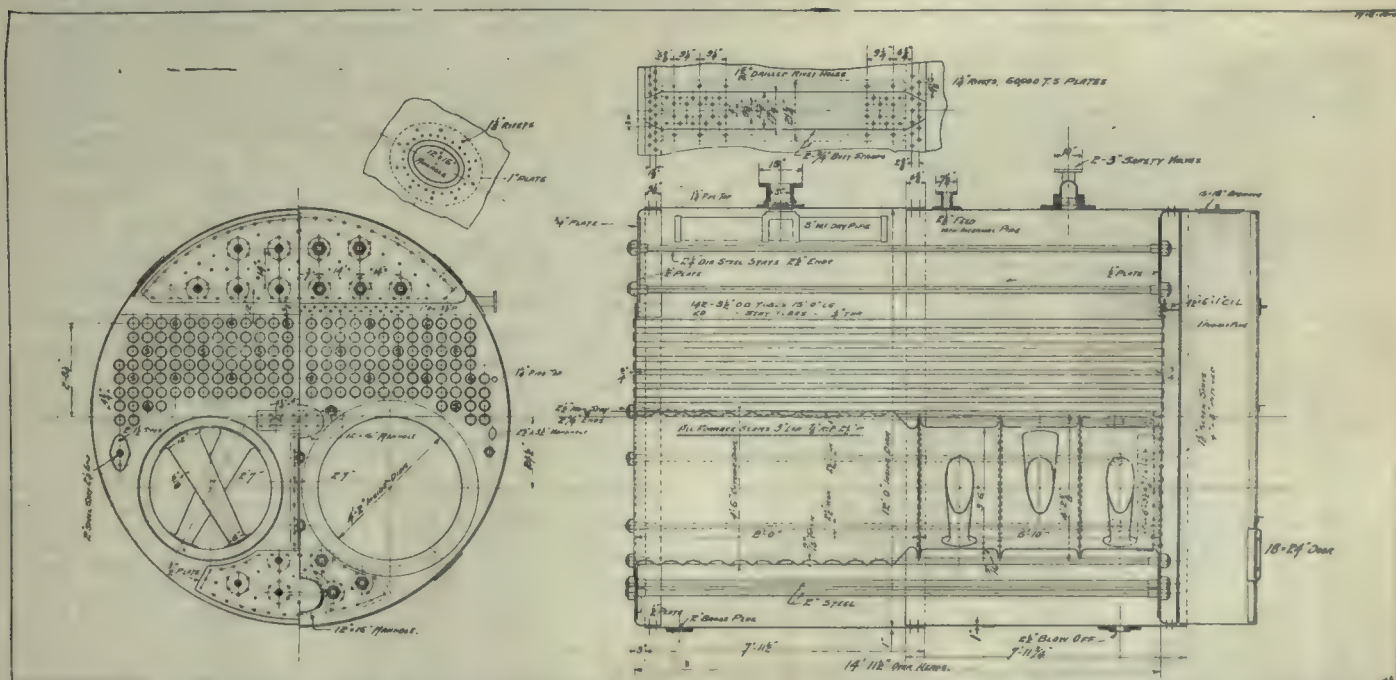

the plant. On the wall behind the switchboard are mounted the remote controlled oil switches, also the starting and running buses on the 2200 and 550 volt motors. The transformers are of Canadian Westinghouse make, and consist of three 50 k.w. units transforming the line current at 2200 volts down to 550 volts for the small motors,

#### Steam Heating System

The steam heating system was designed and installed by Bennett & Wright, Toronto. It is of the low pressure vacuum type, steam being obtained from a valve on the boiler header and passed through two extra heavy Kiely & Mueller reducing valves. The first valve reduces the pressure to 80 lbs. and the second to 10 lbs. There is a

connection between these two valves to the heating system in the wash water tank. The layout of the system generally does not present any unusual features except in the filter house where the steel tanks and large surface area of contained water had to be taken into consideration. Attention had however to be given to the matter of the wind pressure on the filter house tending to drive the heat to the opposite side of the building causing inequality of temperature. The total amount of radiation is 17,940 sq. ft. made up principally as follows. Filter house 15,144 sq. ft.; pumping station 1764 sq. ft.; suction well building 612 sq. ft.; chemical house 324 sq. ft.

In the filter house the temperature has to be maintained at 50 degrees Fahr. At the ground floor level, radiators are suspended under the windows on the walls by special steel hangers. The radiators are arranged in two 12 ft. sections one above the other. Radiators are also suspended on the operating gallery and on the skylight. The heating of the entire building can be controlled from a point midway on the operating gallery. At this point is a header with eight connections to various sections of the building, each connection being controlled at the header. The main steam line to header and the header itself are both 9 ins. in diameter. The header controls are as follows:—One for the window low level radiators West side; one for those on the East side; one for the gallery radiators South section; one for the North; two for the coils on the West

DETAIL OF MARINE TYPE, DRY BACK BOILERS, SHOWING "MORRISON" CORRUGATED FURNACES, GALLOWAY TUBES, ETC. MEAN DIAM. OF BOILER SHELLS, 11 FT. 8 INS.; LENGTH OVER HEADS, 14 FT. 11½ INS.; FURNACES 50 INS. IN DIAMETER INSIDE CORRUGATIONS; 142 SMOKE TUBES 3¼ INS. IN DIAM.; WORKING PRESSURE 150 LBS. PER SQ. INCH.

and East sides respectively; two for the skylight or monitor radiators East and West; the centre connection being the steam supply. The control system was adopted in order to equalize the temperature when the wind pressure, already referred to, drives the heat from one side of the building, making the other side too warm, in which case radiators on the warm side would be cut off. The filter house has 15,144 sq. ft. of radiation.

The pumping station has 1764 sq. ft. of radiation and all the radiators in the building have hand valves, and also a "vento" vacuum trap on the return line. These traps allow air and water to pass through but hold steam in the radiator. The chemical house has 324 sq. ft. of radiation and the suction well building 612 sq. ft. The installation in these two buildings is precisely the same as in the pumping station. These three buildings have to be maintained at 70 degrees F. in zero weather.

The wash water tank is heated by steam at 80 lbs. pressure taken from a point between the reducing valves on the boiler. This line is connected to a 2 in. pipe around the tank inside, the steam mixing with the water. A Bawden 40,000 sq. ft. 8-10-10 ins. vacuum pump is installed in the boiler house for drawing the returns from the system under from 10 ins. to 15 ins. of vacuum to the "Cochrane" heater also in the boiler house. The pump is controlled by a Foster vacuum governor. All main steam lines are covered with air cell covering and the radiators are painted with two coats of old bronze. The radiators were supplied by the Dominion Radiator Co.

CHEMICAL FEED APPARATUS INSTALLATION.

### Lighting System

The lighting is on the 3 wire, 110-220 volts, single phase, distribution system and was installed by E. F. W. Salisbury Ltd., Toronto. The distributing mains are run underground from

filled lamp, and sixteen 60 watt lamps in various parts of the building. In the boiler room there are twelve 60 watt lamps and one 100 watt lamp with reflector. There are six 60-watt lamps installed in front of the boilers, near

SECTION THROUGH "DE LAVAL" 36 INS. CENTRIFUGAL PUMP.

the switchboard to the various buildings, the circuits being run to Crouse-Hinds panel boards enclosed in steel cabinets. The wires are carried in galvanized conduits supplied by Conduits, Ltd., Toronto. The lighting in the chemical house consists of two 40-

watt lamps on each landing, also four 100 and one 25 watt lamps with reflectors in the chemical storage. In the coal storage are ten 60-watt lamps. In the suction well building is a cluster light containing five 100-watt lamps. In the pumping station there are ten wall brackets, each with a 200-watt nitrogen filled lamp and angle reflector. There are also six suspended semi-indirect lights, each having a nitrogen

the water gauges. In the filter house there is one cluster light containing five 100 watt lamps over the centre of each tank, equipped with special reflectors. There is also a lamp at each operating table, making a total of 15 lights, ten of 500 watt capacity and five of 300 watt capacity. There are also a number of lights around the bottom of the tanks and on the stairways. The wharf is illuminated by means of nine 300 watt lamps mounted on brackets.

### Efficiency of Plant

In conclusion it should be mentioned that both buildings and equipment represent workmanship of high order. The plant is unusually interesting from an engineering standpoint as it is the first one of its kind to be installed in this country. The contract requires that the filtration plant shall remove 98 per cent. of the B. coli as determined by the standard methods of the American Public Health Association. All turbidity must be removed leaving a bright colorless water free from taste. Such results must be obtained by the use of not more than one grain of alum per gallon of water under average conditions. Among the sub-contractors not already mentioned are included the following:— Cast iron pipe was sup-

plied by the Canada Iron Corporation and the Standard Foundry; all venturi water meters by the Builders' Iron Foundry, Providence, R.I.; filter tanks and steel pipe were made by the Thor Iron Works, Toronto; handrailing, steel stairway and window sash by the A. B. Ormsby Co., Toronto; bricks came from the Don Valley Brick Works, Toronto, and the structural steel was supplied and erected by the Dominion Bridge Co., Montreal and Toronto.

### CANADIAN PEAT RESOURCES

ATTENTION is being drawn to the possibility of expansion of Canadian commerce and industry as a result of the war. This may take the form of domestic production of articles for a supply of which Canada has been dependent upon foreign sources, or of increased exports to other countries of products hitherto supplied by Germany and Austria. Among other things, this emphasizes the importance which development of the latest resources of Canadian peat bogs might readily assume if full advantage of the new conditions arising from the war were taken. Sulphate of ammonia, the chief by-product of European peat plants, is a valuable fertilizer worth about \$60 per ton. The world's production last year is estimated at 1,365,000 tons, worth about \$80,000,000, says the Journal of the Canadian Peat Society.

Many Canadian peat bogs are rich in nitrogen, and, therefore, suitable for this industry, and inquiries have already been made by British capitalists with a view to establishing chemical works in Canada, provided that a sufficient supply of peat can be guaranteed. Apart from the potential value of our peat bogs as a subsidiary source of fuel supply and for production of sulphate of ammonia, there are numerous other products, such as moss litter, peat dust, alcohol, acetic acid, acetone, tar, tar oils, creosote, etc., which might form the basis of paying industries, giving employment to many people, where now we have only waste lands.

### Provincial Locations

Systematic investigation of the peat bogs of Canada with a view to ascertaining their location, extent, depth, character and suitability for production of fuel and litter has been carried on since 1908. During the period from 1908 to the close of the season of 1914 there have been located, delimited, mapped and investigated as to depth, character and quantity of peat available for commercial exploitation as fuel or litter, twenty-five bogs in Ontario, twelve in Quebec, eight in Nova Scotia, six in Prince Edward Island, and seven in Manitoba, fifty in all, covering about 140,000 acres altogether and estimated to be capable of yielding about 115,000,000 tons of fuel. Twelve bogs were found to be in part or

as a whole adaptable for production of peat litter, having an estimated capacity of production of about 10,500,000 tons. Seven Ontario bogs investigated within convenient shipping distance of Toronto are estimated to be capable of producing approximately 26,500,000 tons of fuel.

Seven bogs in the Montreal district could furnish that city with 23,500,000 tons of fuel. Five bogs along the Lower St. Lawrence in Kamouraska and Temiscouata Counties, convenient to the City of Quebec by water, are estimated to be capable of supplying 16,250,000 tons of fuel and 5,750,000 tons of peat litter. Nova Scotia bogs investigated in Yarmouth, Shelburne and Lunenburg Counties will produce 6,250,000 tons of fuel and 500,000 tons of peat litter. Six bogs investigated in Prince Edward Island can furnish 1,250,000 tons of fuel and over 1,000,000 tons of litter. In 1913 Canada imported artificial fertilizers to the value of \$737,656, showing that there is quite a market in this country for peat by-products.

### PHENOMENAL INDUSTRIAL ACTIVITY IN SHERBROOKE, QUE.

THE city of Sherbrooke, Que., is experiencing the greatest outburst of industrial activity yet experienced in its history, metal-working and other plants operating at full capacity, some of them night and day. A number of the more important industries have recently expanded and, having expanded, are still planning for further expansion. Others have extensions in process and the word "extension" here does not simply mean a new wing or a boiler room. It means increasing the floor space and capacity by 25 per cent., 50 per cent., 100 per cent., and in at least one case by over 200 per cent. Of course a great deal of this activity is due to war business; practically all the metal working industries in Sherbrooke doing some branch of work in connection with the supply of munitions. The same is true of the woollen mills, and of at least one of the clothing factories.

A notable example of expansion on account of war business is that of the Canadian-Ingersoll Rand Co., who in the summer of 1914 were employing about 350 hands and who now have about 2,100 hands. Extensions for munitions purposes have also been made by the MacKinnon, Holmes Co., Jenckes Machine Co., etc. The E. & T. Fairbanks Co., besides the work they are doing on munitions, are also turning out a large quantity of scales.

Other industries, without war orders, are all very active in the manufacture of their regular lines. The Canadian Connecticut Cotton Mills, Ltd., who manufacture all the tire duck made in Canada, are completing large extensions which will triple their present capacity.

Before making these extensions, the company had under consideration the question of moving from Sherbrooke, but after looking over various cities and weighing up all considerations, they finally decided to remain where they were.

### DEVELOPED WATER POWERS IN BRITISH COLUMBIA

THE accompanying detail statement shows at a glance the developed water powers of the Province of British Columbia, and indicates at same time those owned and operated by public utility corporations, as well as those privately owned. The horse-power developed is given in each case:—

#### Public Utilities

Owners and Location.	Horse-power.
Vancouver Power Co. (B.C.E.R. Co.), Lake Coquitlam and Lake Buntzen .....	84,500

## INCREASING OUTPUT OF ONTARIO MINERALS

**T**HE mineral production of Ontario for the nine months ending September 30, 1916, shows a gain of approximately 37 per cent. over the corresponding period of last year according to a recent statement issued by the Provincial Bureau of Mines. The figures for the period follow, and for purposes of comparison, those of last year are also given. It will be noted that there has been a considerable increase in the aggregate value, as also in the value of nearly all of the individual products.

SUMMARY OF MINERAL PRODUCTION FIRST NINE MONTHS OF 1916.

Product.	Quantity.		Value.	
	1915.	1916.	1915.	1916.
Cobalt ore, tons	92	98	\$12,472	\$10,591
Cobalt oxide, lbs.	135,337	378,732	107,363	231,947
Cobalt metallic, lbs.	76,979	172,055	66,552	146,167
Cobalt and nickel oxides (unseparated), lbs.	2,501	57,026	500	22,890
Copper ore, tons		1,715		21,685
Copper in matte, tons	14,057	16,989	2,024,658	6,285,930
Gold, ounces	281,712	363,955	5,826,941	7,513,734
Iron ore, tons	302,586	271,034	601,044	673,170
Molybdenite (concentrates), lbs.		15,845	16,085	6,381
Nickel, in matte, tons	24,054	31,046	5,369,536	15,523,000
Nickel, oxide, lbs.	142,483	54,152	16,085	6,381
Nickel, metallic, lbs.	11,905	17,435	4,782	7,618
Pig iron, tons	354,153	501,410	4,510,906	6,686,965
Silver, ounces	17,178,429	16,203,091	8,030,469	9,750,040

### Cobalt.

The mines of the Cobalt district appear to have definitely established their supremacy as the source of the world's supply of this mineral. Notwithstanding the war, which has closed the European markets, the shipments of cobalt oxides were much greater, both in quantity and value than in the first nine months of 1915. It will be observed that metallic cobalt is assuming an important place in the list. This is mainly due to its use in the manufacture of special alloys, principally stellite, for high speed tools. Stellite is made of cobalt, chromium and tungsten, and is finding a good demand from munition makers and others.

### Copper

The extraordinary rise in the price of copper, which averaged 27 cents per pound in New York during the nine months, has brought about the opening of several deposits of copper ore chiefly west of Lake Superior, from which shipments have been made to British Columbia smelters. The principal of these mines is the Tip Top, while another at Mine Centre has lately been sending forward to British Columbia a carload of ore daily. The price received by the shippers has averaged 18.5 cents per pound for the copper content. This figure has also been applied to the copper contained in the heavy shipments of matte from the Sudbury nickel-copper mines, and a considerable part of the increase in value of the copper reported is due to the higher valuation, although the quantity shipped was also greater by 220 per cent.

### Gold

The output from the mines of Northern Ontario is steadily increasing, being 28 per cent. in excess of that for the nine months of 1915. Hollinger Consolidated continues to be the chief producer, accounting for 47 per cent. of the total. Dome followed with 21 per cent., and McIntyre-Porcupine with 10 per cent. The other considerable contributors in this camp are Porcupine Crown, Schumacher, Vipond and Jupiter, which together furnished 5.5 per cent. Outside of Porcupine proper, Tough-Oakes yielded \$519,149; Canadian Exploration,

Mond Nickel Co. have been working their mines and smelters at maximum capacity, and the output of nickel contained in the matte product of the furnaces, for the nine months falls little short of that for the full year 1915. The production for 1916 will probably exceed the production of 1915 by 20 per cent. The valuation of the nickel in the matte has been increased from about 11 cents per pound (the figure adopted by the mining companies), in 1915 to 25 cents per pound in 1916. Nickel refineries are being erected in Ontario by the International Nickel Co. and the British America Nickel Corporation, the latter of which is developing the Murray mine. Small quantities of metallic nickel are being produced from Cobalt ores by the Deloro Smelting & Refining Co.

### Iron

The whole production of iron ore was from the Helen and Magpie mines of the Algoma Steel Corporation. At the latter, the ore (siderite), is roasted previous to shipment. Four blast furnace companies at Port Colborne, Sault Ste. Marie, Deseronto and Hamilton respectively, produced pig iron in quantity 41 per cent., and in value 48 per cent. greater than in the corresponding period of 1915.

### Silver

The mines at Cobalt continue to produce, though on a slowly diminishing scale. The number of fine ounces contained in the shipments of the nine months was 975,538 below the record for the same period of last year, but, owing to the much higher prices that have prevailed for silver, the return of the mining companies was \$1,719,571 greater. Silver started the year at 56.76 cents per ounce and rose to a maximum in May of 74.27 cents, when it receded to 63.06 in July, reaching 68.51 cents again in September. In 1915, the monthly average was 49.75 cents per ounce. Nipissing still leads in production, Mining Corporation coming next, followed by Kerr Lake, Coniagas, McKinley-Daragh-Savage, Seneca-Superior, Temiskaming, etc. The flotation process is likely to assist materially in increasing the production of silver at Cobalt. It has been introduced at the Buffalo mine, where it is treating successfully low-grade rock containing 5 or 6 ounces per ton. From the gold ores treated during the period, 66,347 ounces of silver were obtained, and from the copper ores 607 ounces.

Croesus and a small output from Dome Lake amounted to over one-quarter of a million dollars. At Teek-Hughes (Kirkland Lake) the mine has been developed and a mill built which will be put in operation as soon as the power transmission line now being erected from Cobalt has been completed. Other prospects here, the Lake Shore, Wright-Hargrave, Kirkland Lake Gold Mines, La Belle-Kirkland and Sylvanite, are also being developed. This is a promising camp. In Gauthier township, the Huronian mine is being worked under a lease. Several discoveries of gold were made during the summer in Benoit township, but there has not been time to prove their value. At Tashota, the Tash-Orn Co. has bought the Wells claim and has put in machinery to give it a thorough test. This company is also working the King-Dodds claims. A diamond drill has been operated on the Devaney, Reamsbottom and Cive claims.

### Molybdenite

There is a demand in Britain for tool-steel purposes, and several deposits of the ore in Eastern Ontario have been opened and are being worked. There are dressing plants at Renfrew and Ottawa, the latter operated by the Dominion Mines Department. Ferro-molybdenum is also being made at Orillia and Belleville. The supply of molybdenite throughout the British Empire has been reserved as a war measure and a price of 105 shillings per unit fixed for concentrates delivered at Liverpool. This approximates \$1 per pound here.

### Nickel

The Canadian Copper Co. and the

**St. Lawrence Ship Channel.**—The ship channel of the St. Lawrence River for 220 miles below Montreal has been continuously undergoing improvement: lighthouses, lighted buoys, semaphores, wireless telegraph, signal stations, pilotage arrangements having not only been established but their service efficiency developed to the fullest extent.

# Waterous Engine Works Company

LIMITED

BRANTFORD, ONT.

Plant and Product

## Staff Article

*Important as may be the future development of Canadian export trade, the soundness of such development is a first consideration. The business whose growth forms the subject of this article possesses the desirable feature of having foreign fields available whose market conditions, based on raw material and consuming power, are closely analogous to our own, and will be more so when conditions again facilitate normal development of world resources.*

**N**O MORE interesting records of the growth and development of the Dominion of Canada offer themselves to the student of industrial economy than those based upon the career of such firms as that which forms the subject of this article. Seventy-two years is more than the span of modern life, yet while the founders of the firm have left the sphere of their earthly activities, the business which they established remains, a monument to their thoroughness and integrity, and, in its present extended and active form, live evidence that their successors have inherited that ability, foresight and progressiveness, which have made the name of Waterous familiar to machinery users in the four corners of the globe.

### Pioneer Period

In the year 1844, P. C. Van Broeklin laid the foundation of what is now the Waterous Engine Works Co., Ltd. The scene of operations was a small building on Dalhousie Street, present-day inhabitants being guided to its location by reference to a livery establishment. Conditions under which the plant was operated seem primitive in the light of modern conditions, yet the very source of power by which the work was then done would seem to

have been an inspiration throughout the years of development—almost three-quarters of a century—which lay before the youthful concern. In 1848, when the late Charles H. Waterous became interested in the business, the motive power for driving the machinery in the little engine shop amounted to one horse-power nominal, brake, and indicated, developed by a single specimen of man's best friend, which, with traditional faithfulness, journeyed round the cellar floor from morning till night.

### Evolution of Product

The product of the firm gradually broadened with continued prosperity and the nature of its work through all these years has been closely indicative of conditions and demands existing through-

out the country at different stages of its development. Threshing machines, plows, stoves, and sawmills, four very staple lines, were the principal directions of early efforts, to be followed at a later date by fire engines, these latter in turn being supplemented by steam engines, boilers and roadmaking machinery, in all of which the firm's name stands for the best of quality in materials and workmanship.

Each succeeding decade saw additional buildings erected until all available space surrounding the original site was occupied. Ultimately, in 1895, the site of the present factory was obtained and buildings, of a design and nature commensurate with the firm's reputation and equipped with modern plant and machinery, were raised, which, however,

have been subject to additions also in recent years.

The product of the plant consists today of equipment for five distinct lines of industry in addition to such special and general work as may be suited to the shop equipment. These lines are:—

(1) Power plant equipment—This includes high-speed automatic engines, heavy duty mill engines, portable and stationary engines—boilers of all types, including return tubular, vertical, locomotive and

ENTRANCE TO WATEROUS ENGINE WORKS CO. MAIN OFFICE BUILDING.

marine accessories, such as pumps, injectors, air compressors, condensers and coal handling plant.

(2) Sawmill equipment—The production of sawmill machinery has advanced in step with the development of Cana-

riages; large and small sawmills, band mills, etc., are a few of the principal items, in the design and development of which the firm has taken a leading part.

(3) The great growth of the paper industry in recent years afforded an allied

cessory equipment, such as conveyors, etc., indicate the wide manner of the company's efforts in this line.

(4) Good roads are neither obtainable nor maintainable if proper equipment be not procurable and Waterous products for this purpose have more than kept pace with the requirements of modern road construction. Starting with the rough rock and passing over crushers, screens, conveying apparatus and graders, the culmination of roadmaking plant is reached in the steam road roller.

(5) The adoption of motor fire apparatus by city fire departments created a considerable demand for equipment of this type. Steam fire engines, self propelled apparatus, and horse drawn sets with gasoline driven pump are the principal output of this department. Hose waggons, reels, and hook and ladder trucks are also included in this line.

To be satisfactory to producer and purchaser alike, such a variety of material must be produced systematically, in as large quantities as commercial considerations prove desirable, while quality is an essential where long life and satisfactory service are demanded.

GENERAL VIEW OF INTERIOR OF MAIN OFFICE.

dian forest wealth. From the time the timber logs are drawn from the river down which they have been floated from the lumber camp until they leave the sawmill in the form of rough dressed lumber destined for the multifarious uses of civilized life, the material is seldom out of contact with some item of Waterous equipment. Log handling apparatus, such as log haul-ups, chains, drives, deck equipment, etc.—feed car-

field in which the company's experience stood it in good stead. Complete pulp- ing machinery outfits form a frequent portion of the firm's output, a notable instance of their capabilities being shown some time ago when they shipped 63 earloads of machinery, being practically the entire pulp mill equipment for a paper plant in British Columbia. Cutting-up rigs, barkers, grinders, beating engines, screens, degenerators and ac-

#### Modern Plant Development

As previously mentioned the present plant was laid down in 1895, and besides the main building, 300 ft. x 120 ft., there were also erected of suitable proportions, boiler, blacksmith, moulding and other shops. At the end of the main building facing Market street, is the office building, a handsomely appointed structure of appropriate architecture, having a floor space of 40 ft. x 120 ft.

MAIN BAY OF FOUNDRY, SHOWING DOORS IN END OF BUILDING FOR CRANE TO PASS THROUGH. NOTE ALSO SAND PIPES FROM GALLERY AND RADIATORS ON COLUMNS.

On the first floor are the drafting room and superintendent's office, having convenient access to the main shop and other departments. The second floor contains the general office conveniently arranged and fully equipped with mod-

Sand and coke are received on a track paralleling the foundry on the outer or north side and are dumped into a pit below the track, from whence they are elevated to the gallery, whence a distributing chute delivers the coke to a stor-

a number of openings in the floor, the sand can be delivered to various chutes leading to the desired part of the moulding floor.

Pig iron and limestone are stored in bulk in the foundry yard and brought up

VIEW IN SIDE BAY OF FOUNDRY FOR LIGHT FLOOR MOULDING, SHOWING EXCELLENT LIGHTING AND HANDLING FACILITIES.

ern devices for the handling of commercial business routine. On the third floor is situated the blue print room and photographic department, the constant improvements and additions to the product rendering the services of such a department very essential in record and publicity work.

The completion of the Market street plant saw the company enter on a further period of activity and in 1912 a new foundry was completed so that the production of castings could be maintained on a scale and of a quality which the increasing requirements of the machine shop rendered imperative. In the illustration of the factory, the foundry can be seen on the opposite side of the lot from the main shop and running parallel to it, the old foundry extending along the thoroughfare between the two buildings.

#### Foundry Department

The foundry is 240 ft. x 110 ft. and is of monitor construction with a centre bay 50 ft. wide, and two side bays 30 ft. wide. The north, or outer bay, is provided with a gallery along its full length, forming the charging floor, and also providing ample space for sand and coke storage, sand tempering machine, etc. The gallery construction is particularly suitable, the floor being of reinforced concrete having a thickness of 6 in., supported on I-beams resting on girders supported by the shop columns.

age space next the charging floor, while another chute directs the sand onto a travelling belt which conveys it to any one of several storage bins.

Conveniently situated between the

to the charging floor by platform elevator, arriving close to the platform scale for weighing purposes before entering the cupola. Two cupolas are installed—a 72-in. Colliau and a 60-in. Waterous,

various sand bins to the mixing machine which delivers the tempered sand into a hopper-shaped truck with a bottom discharge, so that by placing the truck over

blast being provided by an A. B. C. Sirocco motor-driven fan.

#### Building Features

The main bay forms the subject of an

illustration, which conveys some idea of the spaciousness and airiness of the building. As will be seen, this bay is used for floor moulding and the production of heavier castings. The head room

other foundry equipment are stored. The exit doors are electrically operated, and when open in summer have a beneficial effect on the ventilation.

The floor of the main bay for a space

however, one Mumford 10-in. jolt rammer adapted for both moulds and cores, and two Pridmore roll-over draw pattern machines, as well as a pulley moulding machine, which handles work from 12 in. to 18 in. diameter.

#### Side Bays

On the floor of the north bay are arranged the core makers, bench moulders, cupola room, etc., the core ovens being situated in a suitable extension on the outside of the bay.

The south side of the main bay is occupied by a 30 ft. bay devoted to lighter floor work, and served with a 5-ton traveller. In addition to the ample side lights, roof lights are also provided. Exhaust steam from the power plant heats the building by means of radiators enconcealed between the flanges of the main shop columns, while a sprinkler fire protection system is also installed. The space formerly occupied by the old foundry is now turned to advantage in the shape of very completely equipped cleaning room, with tumbling mills and cranes, an extensive exhaust system having been installed, which maintains a remarkable freedom from dust in what is usually a dirty corner in most shops.

#### Boiler Manufacture

The supplying of complete plants to the various provinces of Canada and to different foreign countries has involved the building of boilers to suit many varied requirements, resulting in an unique experience in boilers and boiler making. Situated in the quadrangle formed by the main buildings, already referred to, is the boiler shop, equipped with machinery and tools to turn out the previously mentioned types of boilers. Planing machines, bending rolls, tube hole cutters, hydraulic and pneumatic tools and appliances enable the work to be produced in a thoroughly substantial manner.

The return tubular type of boiler enjoys a high degree of popularity because of its simplicity of design, the absence of complication in its design not only permitting a high degree of thoroughness in its manufacture, but facilitating inspection and maintenance when in use. The boiler illustration on this page shows the complete setting of a return tubular boiler to conform to the laws of Ontario. Full suspension is provided boilers 16 ft. and over in length, smaller boilers having variations according to size.

A very complete range of locomotive type boilers is produced, from 25 to 150 horse-power, the largest size having an overall length exceeding 23 ft., with a shell diameter of 66 in., and suited for steam pressure of from 125 to 172 lbs. per sq. in., according to size and specification. Plain grates and shaking and dumping grates are supplied to suit any variety of fuel, the design of these.

A BAY IN THE BOILER SHOP, WHERE BOILERS OF ALL TYPES AND TO MEET ALL SPECIFICATIONS ARE BUILT.

to the bottom chord of the roof truss is 30 ft. 9 in., while 7 ft. 6 in. lower are the crane rails which carry a 15-ton, 3-motor Northern electric travelling crane. This crane serves the full length of the main bay, and is provided with exit doors in the end of the building, by means of which it has access to a further 120 ft. of track, where heavy flasks and

of 80 ft. x 50 ft. is covered with a system of pits and grids for bolting down large flasks; the bars being spaced 4 ft. apart at a depth of 6 ft. below floor level.

As the product of the factory is of quite a varied nature, the absence of any great amount of repetition work precludes the adoption on a large scale of moulding machines. There is installed,

RETURN TUBULAR BOILER WITH FULL SUSPENSION SETTING. FIRE GRATE AND FRONT TO MEET REQUIREMENTS OF PROVINCIAL GOVERNMENT.

along with various types of boiler settings being the result of accumulated experience under different conditions.

#### Power House

Flanking the boiler shop is the smiths'

interior, the large driving belt being observable over the top of the generator unit in the foreground. The belted engine is of the Ridgway Corliss type, with cylinder 19 in. dia. x 18 in. stroke, de-

is obtained from a G.E. alternator, and direct current at 500 volts from an Electrical Construction Co. dynamo, both being belt-driven by a 10 x 10 in. McEwen engine developing 65 horse-power at 325 revs. per min.

#### Main Building

The machine shop, tool room, erecting department, test floor, and shipping dock are located on the floor of the main building, while the surrounding galleries accommodate the pattern shop and the finishing and painting department for light work. With a width of 120 ft. and length of 300 ft. this, the principal building, is of substantial construction and dignified design. It is the original building erected in 1895, and, while factory construction and operation ideas have altered with the times, this shop, with its specially-adapted equipment, continues to fulfil its mission in satisfactory manner. Several views are reproduced showing the diversity of work handled.

#### General Features

A feature of the equipment is the large proportion of Canadian-made tools installed, the types most in evidence being planers, boring mills, horizontal borers, milling machines and medium and large engine lathes. The production of small parts in quantity is carried out on a number of screw machines, turret lathes, and similar specialized tools. A tool of peculiar interest is a shaft-straightening machine. The device proper consists of a species of punch press frame with an anvil block for supporting the shaft, while the swage block on

AIR COMPRESSOR AND HIGH VOLTAGE GENERATING EQUIPMENT FOR MAINTAINING SERVICE IN FACTORY DEPARTMENTS.

shop, where a wide variety of general forging and welding is performed, while situated transversely at the near end of these is the power house building consisting of boiler house and engine room. A view of the boiler house interior is reproduced, showing a battery of six Watrous return tubular boilers, the accessory equipment including a duplex steam feed pump by the Snow Steam Pump Works and a Webster feed water heater.

As engine builders, the company would naturally be expected to develop its own

developing 235 horse-power at 235 revs. per min. The generator set referred to consists of a Ridgway dynamo direct connected to a 14 x 16 in. McEwen engine, developing 145 horse-power at 250 revs. per min., this being a standard set in the series of McEwen engines built by the company.

Hydraulic power is obtained from a duplex steam-driven plunger pump and pneumatic power from a steam-driven Blaisdell air compressor of

PORTABLE LOCOMOTIVE TYPE BOILER MOUNTED ON SKIDS TO FACILITATE TRANSPORT AND ERECTION.

supply of energy, whether mechanical or electrical. The main shop drive is by belt from a steam engine, this unit being shown in the illustration of engine room

the two-stage type, having cylinders 18 x 12 x 12 in. running at 150 revs. per min. High voltage current for special purposes at 1,150 volts

BATTERY OF SIX RETURN TUBULAR BOILERS SUPPLYING STEAM TO FACTORY ENGINES AND PLANT.

top receives the impact of the blows delivered by an eccentric-operated ram. On either side of the machine extends the bed about 40 ft. over all, which has

gear-driven supporting rollers arranged in pairs at suitable intervals, by means of which the shaft is revolved, so that the deviations from perfect straightness can be ascertained over any portion of the shaft. Any portion can thus be chalk-marked individually and straightened until by the elimination of local kinks it is possible to consider the shaft as a whole, after which little difficulty is experienced in removing the imperfection.

In this, as in many other jobs around a general engineering works, the elements of personal skill and

VIEW OF MAIN SHOP INTERIOR SHOWING VARIOUS MACHINES IN COURSE OF ERECTION.

familiarity with operations have considerable influence on the smoothness and satisfactory nature of the product, and conditions show that the firm is exceptionally fortunate in the fidelity of its employees. In few lines of work is this so necessary as engine building, and the long record of success enjoyed by Waterous engines of various types is satisfactory evidence of this fact.

#### Steam Engine Products

The varied requirements and frequently strenuous conditions under which prime

movers are operated in pioneer districts of a young country are in a great measure responsible for the different types of engines built by the company, resulting in the production of steam engines suited for the rough usage of the lumber camp and, on the other hand, the highest class of engine for electric generating work, factory and mill driving, where economy of running and regularity of operation are the chief desiderata. The former type is exemplified in their centre crank engines of general and heavy duty types, in which power, durability and simplicity are outstanding features. The design is characterized by the use of a Corliss type of steam valve located under the cylinder and operated by a single eccentric from the crank shaft. A perfectly balanced valve is obtained, which, along with short travel and large bearing surfaces, insures a high degree of longevity in this vital part. A sensitive type of throttling governor exercises a direct control over the speed.

#### McEwen Engines

More than twenty years ago the McEwen engine was placed on the market by the Watrous Co., and an enviable record has been built up around this type of prime mover. It is a high-speed automatic engine specially designed for close governing under excessive load fluctuations, such as electric service of all descriptions, mine haulage, crane work, etc. A direct connected generating set is illustrated on page 704, from which the general

MODERN TYPE OF DOUBLE CUTTING BAND MILL. NOTE TENSION WEIGHT, BAND GUIDES, AND WORM ON SUPPORTING ROLLER FOR CLEARING WORK.

design of the engine is apparent, the bed being of heavy construction, with the sides open for the purpose of adjusting cross-head shoes and wrist pin boxes. Guides, main bearings and end of bed are machined at one setting to insure perfect accuracy. A feature of the main bearing design is the arrangement of the babbitt liners, which may be removed by simply relieving them of the weight of the shaft, thus obviating the necessity of removing armatures of direct connected units before removing bearing liners.

A swivelling eccentric adjustment is provided for the cross-head shoes, which assures a full bearing on the guides and allows adjustment to be made by simply loosening a single nut and turning a bolt to draw in or force out the shoe as required. Accurately balanced discs are fitted to the crank shaft, which is a single-piece forging.

The remarkable regulation for which these engines are noted is obtained through a simple form of quick-acting governor of the flywheel inertia bar type.

Governing limits of one revolution are obtained, the instantaneous variation in speed when full load is thrown on or off being seldom more than 1 per cent.

#### Road Rollers and Fire Engines

A natural development of the firm products was the building of road-making machinery and fire-fighting equipment. Long experience in engine and boiler building rendered the production of steam road rollers

TURNING A LARGE FLYWHEEL. A CAPACITY JOB FOR ONE OF THE BORING MILLS.

STANDARD TYPE OF TWO CYLINDER ROAD ROLLER.

STANDARD TYPE OF STEAM FIRE ENGINE.

VIEW OF HEAVY MACHINE SHOP. LARGE PLANERS IN FOREGROUND.

a matter of comparative simplicity, the success of which is evidenced by the presence of these machines in all parts of the Dominion where road-making is in progress. As will be observed from the illustration on page 705, the English design has been followed, having a locomotive type of boiler, with double cylinder side by side engine, geared down to road wheels, having bar steel spokes cast into a fellow ring, which in turn is riveted into the tire. Extension shaft with driving pulley is provided for the opposite end of the crank shaft from the flywheel, which enables the engine to be used for driving all kinds of plant when not engaged on rolling.

The ultimate adoption of motor-driven fire apparatus was early recognized by the company, and their product as illustrated is representative of standard

practice in modern fire-fighting equipment. While greatest interest centres in the monster units employed by city departments, the requirements of small towns and villages have not been overlooked, and a view is reproduced on page 707, showing a horse-drawn gasoline-driven fire pump which has been adopted by numerous small municipalities. A number of these are shown in course of construction, from which it will be seen that a four-cylinder engine is mounted directly over the rear axle, and is coupled through a friction clutch to a simple rotary pump, having a capacity of 400 gals. per min. at 1,000 revs. per min. The capacity of this outfit is such that with 1,000 feet of  $2\frac{1}{2}$  in. hose in use, it will throw a stream of water 125 feet high, using a  $1\frac{1}{8}$  in. nozzle, while with three  $\frac{3}{4}$  in. nozzles a height of 100 feet can be obtained.

### Sawmill and Pulp Machinery

Present and future developments of the lumber and pulp industry not only in Canada but in all forest-bearing countries, impart peculiar interest to these lines of machinery which form the major portion of the output of this plant. The lumber industry being the old established of the two, it is only natural that sawmill machinery is more closely associated with the firm name, especially as sawmill equipment is purchased by a much greater number of individual users than is pulp machinery.

Prominent amongst woodworking equipment are band mills and carriages, two illustrations being shown of representative items in these lines. The type of band mill illustrated is the result of an entire revision of designs whose evolution had been contemporaneous with that

BAND MILL UNDER TEST IN SHOPS DURING CONSTRUCTION.

GRINDING EQUIPMENT IN PULP MILL. TYPICAL OF MANY WATEROUS INSTALLATIONS.

of the industry. This mill, known as the "New Model," retains all of the essential features which first made the band mill a success. As shown in cut this mill is equipped for double cutting, and possesses interesting features in the tension device for the band and the method of constructing the lower wheel. The tension weight employed is hollow, and supported on an internal spring, which, combined with knife edge fulcrums on the tension arm gives an extremely sensitive system so that when a sudden vibration or jar is thrown on the mill, the extra tension is absorbed instantly by the spring before being transferred to the saw. The lower wheel, visible through the floor, is made entirely of iron, with the arms attached to the rim in such a way that they connect each side of the rim to the opposite end of the hub. The hub itself

SHIPPING DOCK IN FACTORY WHERE PLANT EQUIPMENT FOR ALL PARTS OF THE WORLD IS PACKED AND LOADED ON CARS.

is cast in two parts, each attached to one set of arms, thus allowing perfect contraction of the arms without any strain. A wrought iron centre is bolted into the hubs and is finally secured on the mill mandrel with a ground taper fit. The inner side of the rim is steeply beveled so that sawdust falling on it is immediately thrown off and does not accumulate so as to throw the wheel out of balance.

#### Typical Sawmill Equipment

The numerous appliances involved in the handling of lumber in sawmill plants are all developed to a high degree of perfection, the band mill carriage illustrated on this page being a typical example of lumber handling machinery. This carriage travels on a track of suitable length

FEED CARRIAGE FOR BAND MILL, SHOWING DOGS FOR HOLDING LOGS ON THE SEATS, AND NETWORKS FOR FEEDING FORWARD.

HORSE-DRAWN GASOLINE FIRE ENGINES IN COURSE OF ERECTION.

and feeds the log against the band saw. The log rests on the transverse castings or log seats, being held down tightly in position by clamping spikes or dogs carried in knee castings, the knees being set forward by means of networks which determine the thickness of board cut by the saw. Considerable ingenuity is evident in all mechanism of this class as owing to the conditions under which it is used—rough treatment, distance from repair work, etc., together with required accuracy of operation—it must embody ideas of proven merit and material of reliable quality. These features are much in evidence throughout the entire range of modern sawmill equipment. Log chains and elevators, conveyors, kickers, flippers, niggers and other mechanical devices enable unwieldy logs to be handled and sawn by the minimum of help and with the maximum of accuracy and output.

#### Wood Pulp Production.

Of almost more interest is the equipment involved in the production of wood

pulp for papermaking. A large amount of work is involved in handling the pulp logs, and the log haul-ups, conveyors and stackers are familiar features of pulp mills. When the logs leave the storage pile they pass through cutting-up rigs which cut the logs into billets of certain size, barkers which remove the bark, grinders for reducing the billets to

pulp, to be followed by the necessary machines for screening, washing and drying the pulp, finally delivering it in condition to be taken to the paper mills. A view of a Waterous installation of grinders is shown on page 706, the characteristic appearance of the grinders being due to the radial cylinders which feed the billet of wood against the periphery of the centrally located grindstone.

#### Conclusion.

In all of the work referred to, it will be recognized that experience counts. When C. H. Waterous died a few years ago, the responsibility of continuing the work so ably developed by him rested upon his son C. H. Waterous, Jr., who, along with other members of the firm, today directs the activities of the company, the officers being: President and manager, C. H. Waterous; secretary, F. T. Wilks; treasurer, D. J. Waterous; directors, J. E. Waterous, C. H. Waterous, D. J. Waterous, F. T. Wilks and F. J. Waterous. The continuity of policy thus assured is

an asset of considerable value and the increased opportunities which the future may offer will, therefore, be recognized and taken advantage of with the same success as has been the case since the early days of pioneer effort.

### CANADIAN TRADE CENTRES

THAT Montreal is the leading trade centre of Canada is shown in various ways in the report for the year 1915-16 of the Department of Customs. It is fairly certain to remain so, although, with the development of other centres, its proportion of the whole trade done in the country may not greatly advance. In the statement of exports and imports it is given a lead which may be taken to justify what has been done in recent years in the way of making the St. Lawrence waterway safely navigable by the larger class of ocean vessels. In spite of the war the trade of Canada with other countries was in 1915-16 greater than ordinary. The loss in passenger traffic was more than made up by the increase in freight business, which is sometimes the most profitable.

### Exports and Import Values

The total exports for the twelve months were valued at \$882,872,000. The imports are given at \$564,505,000, of which \$542,077,000 was "entered for consumption." The ports which figure most largely in the total, and the amount of the exports and imports credited to them are as follows:—

	Exports.	Imports.
Montreal .....	\$191,170,000	\$147,003,000
St. John, N.B. ....	121,042,000	11,057,000
Fort William .....	81,284,000	3,283,000
Niagara Falls .....	41,141,000	2,622,000
Port Arthur .....	33,928,000	1,890,000
Bridgeburg .....	32,308,000	1,908,000
Coaticook .....	30,080,000	269,000
Halifax .....	26,843,000	9,873,000
St. Johns, Que. ....	22,379,000	3,486,000
Vancouver .....	15,843,000	20,167,000
Sydney .....	7,266,000	1,963,000
Quebec .....	3,991,000	12,145,000
Winnipeg .....	181,000	24,087,000
Ottawa .....	173,000	20,520,000
Toronto .....	134,000	114,604,000

Montreal stands well in front in the matter of exports and imports. It has both water and rail communication with outside countries, and has, among its merchants, men who deal in practically every class of goods in international trade. Next to Montreal in the matter of exports is St. John N.B., while Toronto has second place in the import column. The tables show the existence of lines of commerce not often considered. Port Arthur and Fort William, the twin communities at the head of Lake Superior, show exports combined of \$115,000,000, this being chiefly a development of the grain trade, which in the late fall especially finds its way to the ocean by way of Buffalo and New York. The large fig-

ures of Niagara Falls, Bridgeburg, Coaticook, etc., are the result of the growing trade in produce of various kinds with the United States.

### Customs Collections

The statement of the customs duties collected is also interesting. In some cases the exports credited to a port have little connection with the actual trade of the place, which may be little more than a port of entry for goods coming from far away points. The amount of customs duties collected usually indicates commercial status, however. In 1915-16 the following were the records of collection of duty at the places named:

Montreal .....	\$24,011,964
Toronto .....	20,378,370
Winnipeg .....	6,517,892
Vancouver .....	4,717,180
Hamilton .....	4,480,682
St. John, N.B. ....	2,688,348
Halifax .....	2,412,474
Quebec .....	1,854,243
Ottawa .....	1,378,558
Victoria, B.C. ....	985,326
Calgary .....	922,801
Edmonton .....	696,711
Regina .....	802,950

The Customs collections during the twelve months were \$103,940,000, and the contributions at Montreal were quite 23 per cent. of the total.

### WESTERN CANADA POWER CO.

ONE of the most important requirements of British Columbia in general, and of Vancouver in particular, is the supply of power in the form of electrical energy to the industrial, commercial and agricultural communities. One of the factors in such service is the Western Canada Power Co., which has its hydro-electric plant at Stave Falls, on Stave River, thirty-five miles east of Vancouver, and reached by the C. P. R. main line at Ruskin, where transfer is made to the company's own railway, which runs a daily service between Ruskin and the plant at Stave Falls, six miles north of Ruskin.

From the plant the high tension transmission lines carrying 60,000 volts radiate southward to the international boundary line at Sumas, eastward as far as the Nicomen rock quarries of the C. P. R., and westward to Vancouver city, taking in the cities of Port Coquitlam, Port Moody and New Westminster and the territory included in the municipalities of Mission, Maple Ridge, Pitt Meadows, Coquitlam and Burnaby.

Traversing this same area are two Canadian transcontinental railway lines, two trunk line American railways and a third Canadian line which will eventually connect up with a transcontinental line. Serving this Lower Mainland section of British Columbia, as it is sometimes called, are the salt and fresh waterways which provide unexcelled transportation facilities for those districts and cities.

In connection with this development are three dams—the storage dam, the sluice dam, which will ultimately be made into a solid dam, and the Blind Slough dam. The foundations of the power house are of solid concrete construction, and the superstructure is of steel and reinforced concrete. The building, which is at present 100 feet wide and 90 feet long, is being extended to cover the turbine and generator of the third unit, which is now being set in place, and will be ready for generating power at an early date.

### Power Plant

In the power house are installed at present two 10,000 k.v.a. 3-phase, 60-cycle, 4,400-volt generators, built by the Canadian General Electric Co., driven by two 13,000 horse-power Francis type turbines, built by the Escher Wyss Co. of Zurich, Switzerland. Excitation is provided by two 250 k.w. 125-volt generators, each driven by its own turbine, and each capable of exciting four machines. Governors and oil pumps were also provided by the Escher Wyss Co., the pumps being driven by individual wheels of the impulse type.

Six single-phase transformers of 3,000 k.w. capacity each are located on the main floor, each in its own concrete vault with a steel hatch as a top. A travelling crane of 70 tons capacity spans the entire main floor, placing the transformers as well as the generators and wheels directly under the crane. The control switchboard is in a gallery at the east end of the building, giving the operator full view of every piece of moving machinery. All switches are solenoid operated, and, with the fuses, are located in reinforced concrete cells in a concrete lean-to parallel to the main building. The third unit consists of the same type and size turbine and generator as the two at present installed.

British Columbians are hopeful that the industrial activity already begun will continue to increase. Much hope is entertained that the mining industry will be firmly established on a permanent basis. Western Canada Power Co. of Vancouver is in receipt of many inquiries regarding copper refining furnaces, and regarding the treatment of zinc ores by electricity. The establishment of reduction works anywhere in the vicinity of Burrard Inlet or the Fraser River would certainly lead to great activity, and be the means of permanent employment to thousands of men.

**Canadian Vessel Registry.**—On March 31, 1916, the total number of vessels on the Canadian register was 8,631 of 1,215,021 gross tons measurement, while the total tonnage transferred during the twelve months ending on above date was 25,834, represented by 24 vessels.

FIG. 1. MAIN BUILDING OF THE UNIVERSITY OF TORONTO, NORTH OF AND FACING THE CAMPUS.

## Central Heating and Power Plant, University of Toronto

By L. M. Arkley, M. Can. Soc. C.E. \*

*The operation of central heating plants for the supply and distribution of heat over comparatively large areas has been successfully accomplished in certain instances by progressive municipalities. The private installation of such systems, however, is somewhat infrequent, due probably to absence of opportunity. Such an enterprise as that featured in the present article possesses exceptional interest not only because of magnitude and distances involved, but because of the consistent results which are justifying the wisdom of the undertaking.*

THE buildings which comprise the University of Toronto are situated in extensive grounds, on west side of Queen's Park, in the city of Toronto. Bounded on the north by Bloor street, the west by St. George street, and the south by College street, the 21 buildings, as shown in plan, Fig. 5, present a problem of considerable magnitude and interest as regards the provision of a suitable heating system.

Previous to the year 1911-12, the widely scattered buildings were heated by several separate plants, the most of which were old and inefficient. Electric current for light and power was partly generated in these plants and partly purchased from supply companies. Con-

ditions, therefore, were such that the possible economies which could be effected through the installation of a central heating and power plant warranted such a procedure,

and the gradual reduction of costs since the plant was put in operation is submitted as amply justifying the centralization arrangement as well as that of the equipment installed.

### Power House

The location selected for the central plant was to the east of the Medical Building (4), and adjacent to the western end of the Ontario Legislative Building in Queen's Park. The power house building is for the most part underground, its flat roof being practically level with the pavement in the adjacent driveway in the park, from which the ground slopes down so that the west wall of the building is about eight or ten feet above ground level.

The main object in providing such a location was to facilitate the installa-

FIG. 2—INTERIOR OF POWER HOUSE ENGINE ROOM SHOWING CURTIS TURBO-GENERATOR IN FOREGROUND WITH ALLEN HIGH SPEED UNIT IN REAR

\*Assistant Professor of Mechanical Engineering, University of Toronto.

tion of a gravity return heating system. An additional, though minor advantage, was that it has been possible, by placing ornamental balustrades on roof of the coal bunkers, and the judicious

lative position of the engine room, boiler room and coal bunkers. The boiler room is 58 feet wide, with a total height of 26 feet and contains four Babcock and Wilcox water tube boilers, each of

perheat, and each unit is equipped with a Murphy automatic smokeless furnace to which coal is fed by gravity from the overhead bunkers. These have a capacity of 600 tons, are built of concrete, and, as shown in Fig. 7, overlap the furnaces so that a suitable angle is obtained for the delivery pipes which are fitted with sluice valves at their upper end for regulating the supply of coal. The bunker is 25 ft. wide and 12 ft. high, and the roof forms part of the roadway by which the coal is brought to the plant, the sidewalk, along with the balustrades referred to, being indicated thereon.

An induced draft system is operated in conjunction with the boilers—two 78-in. American Blower Co. fans coupled to Robb fan engines drawing the waste gases from a smoke breeching extending along the back of the boilers (see Figs. 6, 8, and 10), and discharging them into an underground concrete tunnel leading to a brick stack which is built into a corner of the Medical Building (4).

Boiler feed requirements are taken

FIG. 3—KNOX COLLEGE. THIS EDIFICE ALSO FACES THE CAMPUS, AND IS ONE OF SEVERAL RECENTLY COMPLETED BUILDINGS

planting of shrubbery, to almost entirely disguise the location of the plant so that the scenic surroundings of the Legislative Building suffer no detraction whatever.

The ground space occupied by the building including the coal bunkers, is 82 feet in length by 107 feet in width. The sectional view, Fig. 7, shows the re-

403 nominal horse-power, and one boiler of the same make with a rating of 516 horse-power, giving a total of 2,128 boiler horse-power.

All of the boilers operate at a pressure of 150 lbs. per sq. in., without su-

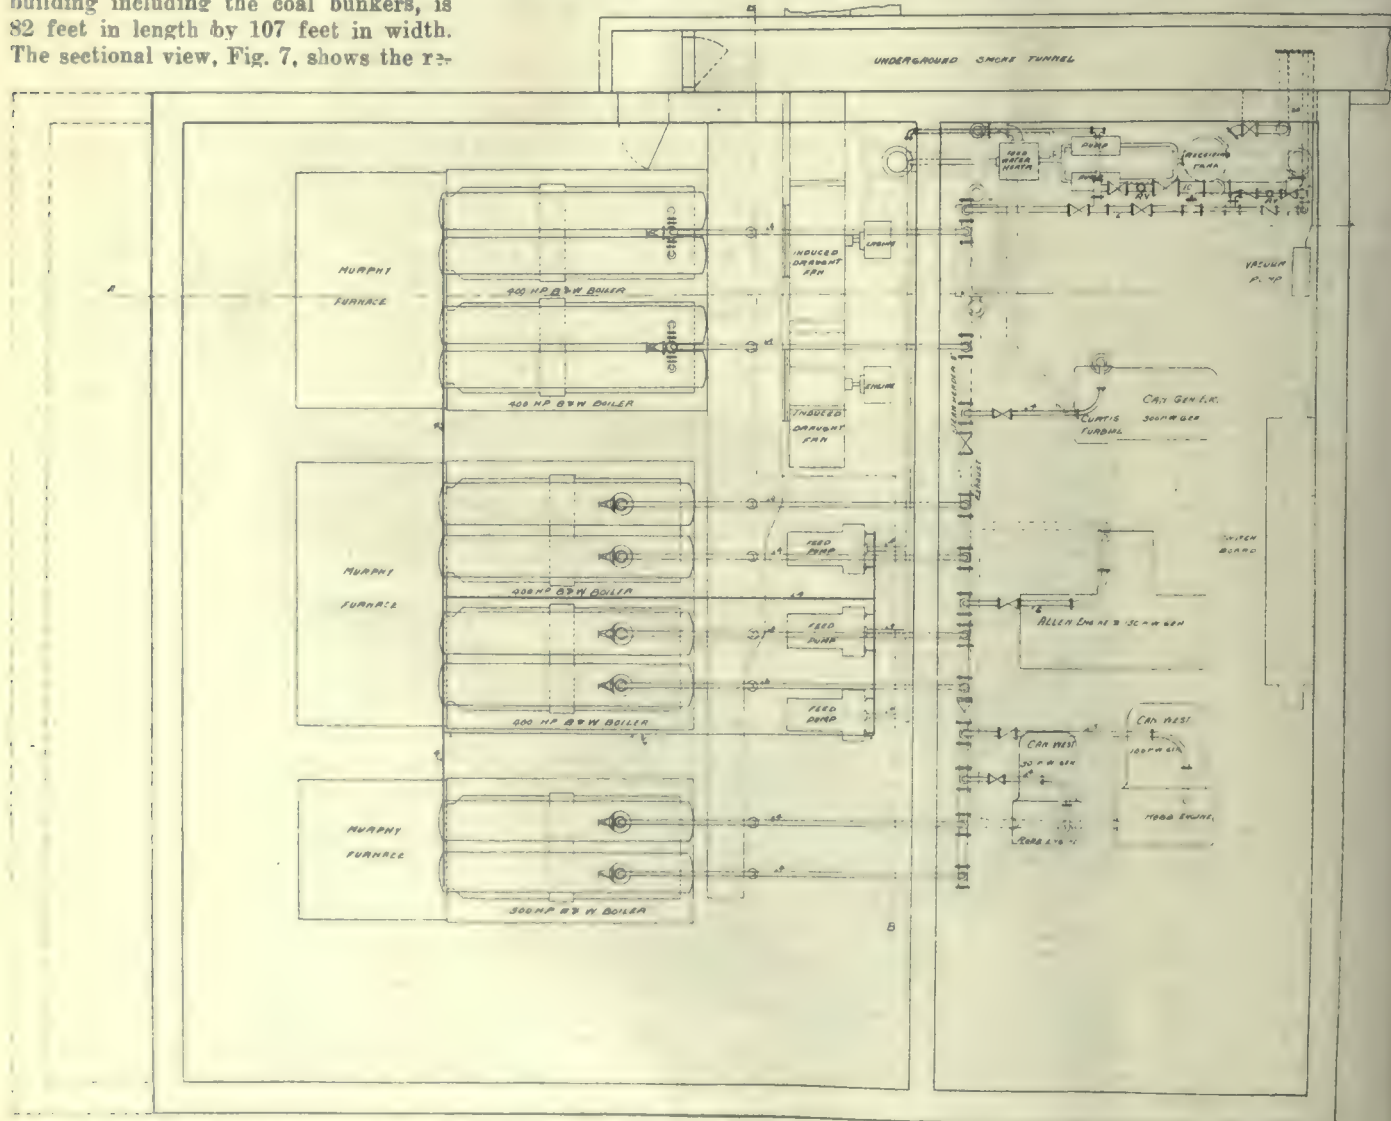

FIG. 6 PLAN OF POWER HOUSE SHOWING LAYOUT OF BOILER AND ENGINE ROOMS, ALSO LOCATION OF UNDERGROUND SMOKE TUNNEL

FIG. 4—DEPARTMENT OF HOUSEHOLD SCIENCE BUILDING, SITUATED ABOUT FIVE EIGHTHS OF A MILE FROM THE CENTRAL HEATING PLANT

care of by an installation of three Smart-Turner duplex steam-driven feed pumps. These are illustrated in Figs. 10 and 11, and are of the outside end-packed plunger type, 10 in. x 6 in. x 10 in., with pot valves. They are situated immediately behind the boilers, and are so piped that two independent methods are available for supplying water to the boilers. At the near end of the pump room, Fig. 10, is the sump, equipped with two small steam pumps for draining purposes, and one Bundy steam trap for taking care of the high pressure drips.

The coal used is a bituminous slack containing about 21 per cent. of volatile matter and this is burned with very little smoke. While the coal is not bought on the B. T. U. basis, samples are taken regularly from the delivery waggons and tested for ash, volatile matter, carbon, moisture and sulphur. This procedure has resulted in the quality of coal received being uniformly high.

#### Engine Room

The engine room extends the full length of the building, i.e., 82 ft., and is 30 ft. wide by 23 ft. high, the floor level being 3 ft. above that of the boiler room. It is separated from the boiler room by a 27-in. brick wall, and although not shown, a hand-operated overhead traveling crane is provided, fitted with a 3-ton Yale triplex block, which enables all maintenance adjustments and repairs to be conveniently made.

The equipment contained in the engine room consists of four steam-driven generating units, switchboard, water-wheeler and feed water heater, with feed water and vacuum pumps, the purpose of the latter being explained under heating section.

The generators are all direct connect-

ed to their engines, and are as follows:

One horizontal Curtis steam turbine, driving a 300 kw. General Electric D.

C. generator, running at 1,500 rev. per min. (see Fig. 2).

One high speed vertical compound reciprocating engine, with generator built by W. H. Allen, Son & Co., Bedford, Eng., cylinders 16 in. and 24 in. x 11 in. stroke, developing 300 kw. at 400 revs. per min. This unit can be seen behind the Curtis outfit in Fig. 2.

Two Robb, Armstrong-Westinghouse units of 100 kw. and 50 kw. capacity respectively—these engines are of the single cylinder vertical type, the former having a 15 in. x 14 in. cylinder, and speed of 275 revs. per min., and the latter a 12 in. x 10 in. cylinder, with a speed of 265 revs. per min., shown in Fig. 12.

All of the engines operate under a steam pressure of 140 lbs. per sq. in. at the throttle, while the generators supply direct current at a pressure of 110 volts, each unit having an individual panel on the switchboard, which has seven panels in all, two being for distribution purposes and the seventh coupled up to one of the local supply companies.

The auxiliary apparatus in the engine

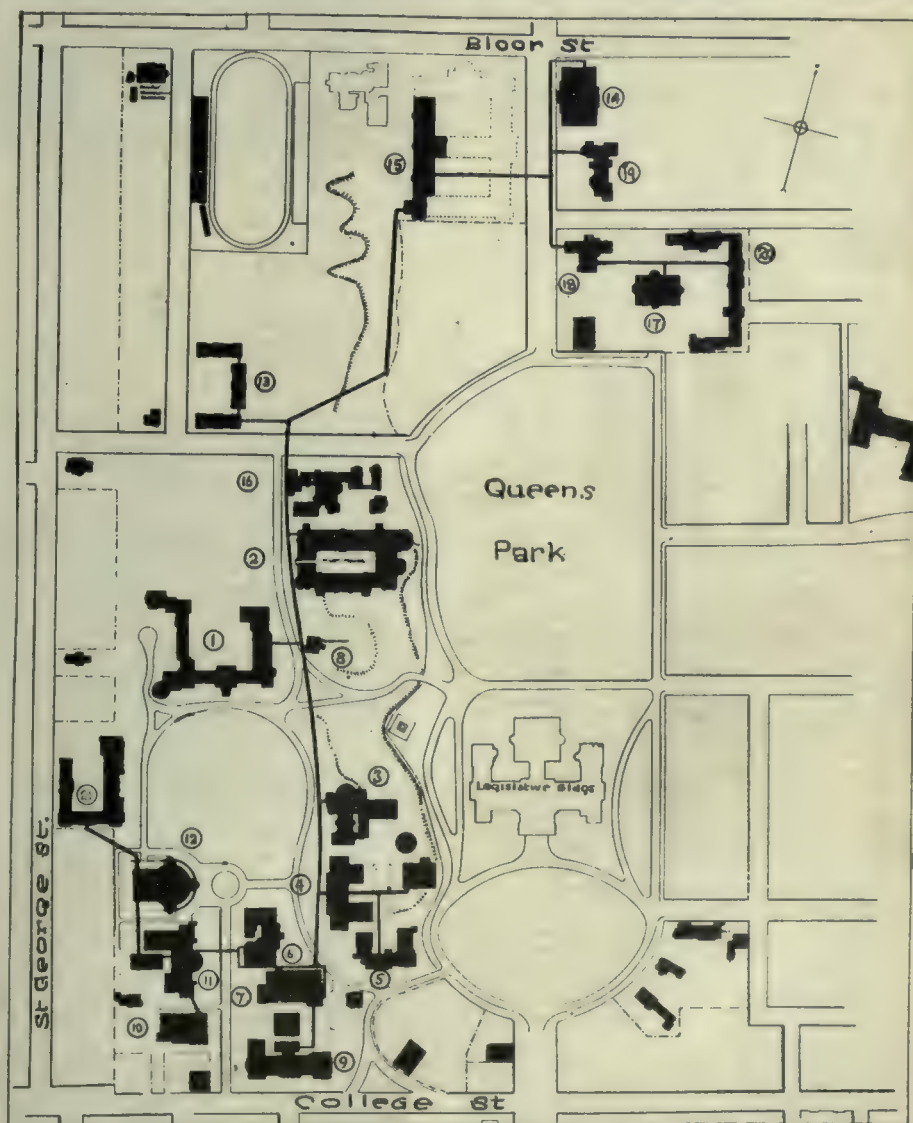

FIG. 5—GROUND PLAN SHOWING LOCATION OF VARIOUS BUILDINGS SERVED BY CENTRAL PLANT

room is illustrated in Fig. 13. At the left of the photograph is a Webster open type feed water heater, which re-

Immediately above the water weigher is the entrance to the tunnel which carries the distributing pipes and cables refer-

hot well in the power house being the low point to which all condensed steam returned by gravity. Of the original buildings heated in this way, the Main and Mining Buildings have been changed to a vacuum system and the same method has been adopted for the recently completed Knox College and for Hart House. In this case the vacuum pumps located in these buildings discharge the returns from the radiation to overhead tanks, from which it flows by gravity into the main return line back to the power house.

The following table gives a list of the buildings heated, together with the number of square feet of radiation in each for the heating season 1914-15:—

Name and No. of Building.	No. of sq. ft. of Radiation.

ceives part of the exhaust steam from the generating units, and is supplied with feed water by two Smart-Turner 6 in. x 5 $\frac{3}{4}$  in. x 6 in. duplex pumps, located next to it. Further to the right is a Kennicott water weigher with a maximum capacity of 65,000 lbs. per hr.

red to later, the 20 in. main being clearly discernible as it enters. At the extreme right is an 8-in. x 12-in. x 12-in. Warren vacuum pump, referred to above.

FIG. 8—ELEVATION OF INDUCED DRAUGHT EQUIPMENT SHOWING SMOKE BREECHING, FAN CASINGS AND SECTION OF SMOKE TUNNEL

#### Heating System

The heating system was originally designed as a gravity return system, the

#### Piping Distribution System

The main heating pipe as it leaves the power house is 20 in. dia., and con-

FIG. 7—SECTION OF POWER HOUSE BUILDING SHOWING ELEVATIONS OF THE VARIOUS UNITS OF EQUIPMENT

tinues of this size to a point west of the Medical Building (4), where it branches north and south in 16 in. mains, and

the heating load required, live steam is introduced by passing it through a pressure reducing valve in the usual way. A

FIG. 9.—BOILER ROOM SHOWING MURPHY FURNACE INSTALLATION.

gradually reduces in size towards the end of the line.

All engines, turbines and steam pumps in the power house exhaust into this pipe, but as the lighting and power load is normally small compared with

pressure of from one to 4 lbs. per sq. in. is carried on the main heating pipe at the power house.

The question of expansion and contraction due to change in temperature is an important one in a steam line of

this length, and it is taken care of by slip expansion joints, the pipe being securely anchored at the proper points. This form of expansion gives satisfactory service if the pipe is looked after and kept well in line, otherwise it leaks.

A question of still greater importance than that of expansion is that of condensation of steam, as excessive condensation means not only a loss of heat, but also introduces the problem of taking care of the water of condensation. The best method of reducing the loss from this source is, of course, to lag the pipes well with some heat insulating material; this feature in the original layout was somewhat neglected resulting in a hot tunnel and large quantities of condensed steam in the main pipe, this condensation being drained from the pipe through traps to the power house. It was found necessary later to instal a vacuum pump in the power house to pump this condensation back and deliver it to the hot well, and with

FIG. 14—SECTION OF TUNNEL CONNECTING KNOX COLLEGE WITH CON-VOCATION HALL

this addition the system works quite satisfactorily.

Besides the main heating pipe, the tunnel contains a live steam main of 5 in. diameter, where it leaves the power house, also the main gravity return line of 8 in. diameter, and a 3 in. return line to the vacuum pump from the 20-in. main. The live steam is carried at 50 lbs. pressure and is used principally in the Main Building (1), Burwash Hall (20), Knox College (21), and the Household Science Building (14).

Besides these pipes all electric wires are carried on the walls of the tunnel.

#### Tunnel Construction

The main tunnel through which all steam pipes and electric wires are distributed to the various buildings, is of concrete and of 5 ft. x 6 ft., inside dimensions, where it leaves the power house. Its walls are vertical and 8 in. thick, while the roof slab slopes from 9 in. at the centre to 6 in. at the walls, and is reinforced where necessary.

The power house is indicated on Fig. 5 by a solid black circle.

FIG. 11—THREE SMART-TURNER DUPLEX BOILER FEED PUMPS WITH OUTSIDE END-PACKED PLUNGERS AND POT VALVES.

Figure 14 shows a section of a piece of tunnel built recently by the Superintendent's Department to connect Knox College (21) with Convocation Hall (12). This shows a considerable improvement over the first tunnel built, in the arrangement of the piping and wiring. The main pipe rests on rollers which in turn are supported by substantial concrete piers securely bolted at the bottom of the tunnel; this point requires attention or the gradual movement of the pipe due to expansion, will work the piers loose in a short time, this trouble having actually developed in the original layout. The plant has been remodeled in many respects since first installed and this work has been done under the supervision of A. D. LePan, Joint Superintendent of Buildings and Grounds, under whose direct supervision the plant is operated.

### Efficiency Test of Boiler Plant

The object of the test was to find the efficiency of the boiler plant under actual working conditions. While the boilers were cleaned shortly before the test, there was no special preparation made to insure anything but a normal efficiency.

The test was conducted by the writer assisted by J. D. Thompson, Demonstrator in Mechanical Engineering, and the members of the 1916 graduating class. A. D. LePan, Joint Superintendent, and W. H. Bonus, of the Superintendent's office, gave every assistance in preparing for the test. The operation of the plant was under the direction of C. Moseley. The accompanying table embodies in its detail the various factors entering into the test, together with the obtained results.

1—Name of Plant	University of Toronto Heating and Lighting Plant
2—Number and kinds of boilers	Five Babcock and Wilcox water tube
3—Kind of furnace	Murphy Automatic
4—Grate Surface—Inclined grates—	
Projected area	328 sq. ft.
Actual area	451 sq. ft.
5—Heating surface—	Total
6—Date	Jan. 17th, 1916
9—Duration	11 hours
<b>Average Pressures, Temperature, Etc.</b>	
10—Kind and size of coal	Vinton, Slack
11—Steam pressure by gauge	153 lbs. per sq. inch
12—Steam pressure absolute	167.6 lbs. per sq. inch
13—Temperature of feed water entering boiler	173° F.
14—Temperature of escaping gas leaving boiler	487° F.
15—Force of draft between damper and boiler	0.4" water
(a)—Draft in furnace	0.16
16—State of weather	Fair and cold (10° above zero)
17—Percentage of moisture in steam	1.5%
18—Factor of correction for quality of steam	98.5%
19—Total coal as fired	67,900 lbs.
19a—Total siftings weighed back and credited to furnace	8,130 lbs.

FIG. 12—AUXILIARY EQUIPMENT IN ENGINE ROOM.

As will be observed from these results, the plant possesses ample capacity for all heating requirements and, being connected to local supply sources, occasional demands for lighting current in excess of the plant capacity in operation can be instantly met without having to force the boilers or start up additional generators. These conditions enable the plant to be run at a fairly steady load with no sudden or unexpected variations so that conditions of at least as great or perhaps greater efficiency than those indicated by the test results are doubtless constantly maintained under regular operation.

### Operating Data

The cost of production for three successive seasons from 1912-13 are tabulated below, as well as tables showing the amount of coal used and the temperatures obtaining during the different months of these seasons:—

FIG. 12.—ROBB-ARMSTRONG ENGINES AND WESTINGHOUSE GENERATORS.

## COST OF PRODUCTION.

	1912-13		1913-14		1914-15	
	Total cost	Cost per sq. ft. radiation in cents	Total cost	Cost per sq. ft. radiation in cents	Total cost	Cost per sq. ft. radiation in cents
Cost of coal .....	\$29,429.52	17.22	\$26,649.23	15.12	\$25,135.64	12.80
Cost of city water ..	510.62	.30	265.90	.15	200.00	.11
Repairs and renewals	2,393.39	1.41	3,674.89	2.08	5,354.06	2.73
Salaries (Engineers, Firemen, Helpers).	8,713.81	5.12	7,992.47	4.54	7,972.25	4.05
Elec. cur. purchased	1,700.66	.65	1,424.24	.81	1,329.32	.66
Total cost of operat'n	\$42,148.00	24.71	\$40,006.73	22.70	\$40,000.37	20.35
Additional Data—						
Total sq. ft. radiation .....		170,221		176,203		196,534
Total current generated (Kw. hrs.)		395,395		351,231		390,655
Total water evaporated .....		112,329,664 lbs.		121,657,911 lbs.		117,424,163 lbs.
Total cost of coal required for evaporating 1,000 lbs. of water under observed conditions ....		26.2 cents		21.9 cents		21.4 cents
Cost of evaporation per 1,000 lbs. steam .....		38 cents		33 cents		24 cents

Note:—1—The increased charge on repairs and renewals is accounted for by extensive alterations which have ultimately reduced the cost of operation.

2—In this distribution of cost no charge is made for light and power or high pressure service.

## POWER DEVELOPMENT AT DOG LAKE

THE city council of Port Arthur, Ont., decided on Nov. 28 to submit a by-law at the January elections to find if the electors want the Hydro-electric Commission to develop, construct and acquire some 30,000 horse-power for the city, probably at Dog Lake. The city at present consumes about 30,000 horse-power, which is secured from Current River, and about 2,300 horse-power, which is secured through the Hydro-electric Commission from the Kaministiquia Power Co. of Fort William. The influx of new industries and elevators into the city will increase the consumption by several thousand horse-power in the immediate future, and in the event of the Kaministiquia Power Co. not being able to supply this from its present plant, another source of power is necessary.

For years this city has been striving to have Dog Lake developed by the Hydro-electric Commission, and it is expected that the vote will be unanimous in favor of it, especially as it will prevent the development of this power by private interests. There is a probability that the city of Fort William may vote on the same by-law and eventually become a partner in the plant if installed, in proportion to the amount of power consumed. The sister city at present has a contract with the Kaministiquia Power Co. which does not expire for several years. The proposed plant is estimated to cost several million dollars.

## PORT OF MONTREAL, 1916 SEASON

THERE came to the port of Montreal for cargoes, during the season which is now closed, 685 sea-going vessels with a total tonnage of 2,119,051, as against 815 vessels last year with a total tonnage of 2,261,374. Although the two totals compared seem to show that last year's business transacted by the port was more than this year, it is believed that further analysis of the figures will show that, if the coasting tonnage included in the returns for all the years were eliminated, the total of ocean-going ships this year would exceed that of any year in the history of the port.

Coal, for example, which has formed in other years a great part of the cargoes brought up to Montreal from the Maritime Provinces, has come in comparatively small quantities this year because of the difficulty of getting tonnage. Last year there were probably two or three times as many coasting vessels as this year. The average capacity for cargo of the ships, which came this year, is also ahead of last year, an-

other result of the large number of coasting vessels in last year's list.

Grain has again formed the major portion of the port's exports. Up to the end of November the exports from the elevators of the Harbor Commissioners and the Grand Trunk Railway reached the goodly figure of 71,646,455 bushels.

### BLOOR STREET VIADUCT, TORONTO, ONT.

ON its completion in December, 1917, the Bloor Street Viaduct, Toronto, will assume its place in the realms of engineering achievement. The ultimate necessity for such a structure had been foreseen for many years, and the rapid development of North-Eastern Toronto during the last decade and a half accentuated the lack of high-

Queen and Gerrard Street bridges, and caused considerable congestion in these thoroughfares, all of which points will be relieved and great economy and convenience obtained through the use of the new means of communication.

The entire viaduct has a total length of 5,267 ft., divided over the three sections indicated on the map as follows:—Don section, 2,219 ft.; Rosedale section, 1,484 ft.; Bloor section, 1,564 ft. The estimated cost of the completed structure is approximately \$2,500,000, and the allotted time for the completion of the work from the date of commencement is exactly three years for the Don section, the general contract for which was let to Quinlan & Robertson on December 17, 1914, and work commenced one week later. The sub-contract for the steel work was let to the Hamilton Bridge Works Co. A feature of the work is the

the major features of interest. It has two 158 ft. arches, two 240 ft. arches and one 281½ ft. arch, the actual distance between pier centres of the largest arch being approximately 300 ft., and height above normal level of Don River being 130 ft. While the preliminary estimates of quantities have been slightly altered as a result of actual construction, the principal approximate quantities on the Don section are: Excavation, 49,696 cu. yds.; concrete, 43,344 cu. yds.; concrete reinforcements, 985,200 lbs.; structural metals, steel, 10,875,370 lbs.; cast steel, cast iron and lead, 485,580 lbs.; total, 11,360,950 lbs.

All of the arches, including the single arch of the Rosedale section, are of the three-hinged, four-ribbed type. The total width of the viaduct is 86 ft., allowing 21 ft. for the car tracks, with 21 ft. 9 in. roadway on each side; while the cantilevered sidewalks are each 10 ft. 9 in. wide. A feature of the viaduct is the provision of a lower deck to carry a future system of underground railways.

PLAN SHOWING THE DIFFERENT SECTIONS OF BLOOR STREET VIADUCT AND VARIOUS CONNECTING STREETS.

way communication in this part of the city to such an extent that in 1913 the sum of \$2,500,000 was voted by the rate-payers of the city to defray the cost of the undertaking, including expropriated land and all other items.

The topography of the locality is roughly indicated in the accompanying map of the viaduct, the River Don flowing through a very pronounced depression known as the Don Valley, which is paralleled on the west by the Rosedale Ravine, those two physical features con-

provision of a bonus-penalty system, the time allowed being divided up over the various sections, such as piers, steel work, etc., the bonus being paid or the penalty collected at each interval; at the time of writing all sections have been ahead of schedule.

The Rosedale section contract was let to the Dominion Bridge Co., the sub-contract for the excavation and concrete work being secured by the Raymond Construction Co. Work on this section was commenced March 24, 1915, with

### LIQUOR AND TOBACCO CONSUMPTION

A PRONOUNCED decrease in the consumption of liquor and tobacco in Canada is indicated by the 1916 annual report of the Inland Revenue Department issued on Dec. 14.

The amount of spirits consumed per capital decreased to .745 gallons; the lowest figure since the year 1900; the consumption the previous year having been .812 gallons, and in 1914, 1.061 gallons. Of beer, 4,950 gallons per head were drunk last year, as compared with the previous one. Wine drinking also decreased, .062 gallons per head being consumed last year, as compared with .095 the year before. There was a large increase in exports of Canadian spirits, 808,135 proof gallons, as compared with

VIEWS OF THE TWO EASTERN ARCHES OF THE DON SECTION, SHOWING FALSEWORK IN POSITION, AND FEATURES OF SURROUNDING DISTRICT.

stituting a natural barrier between the east and west of Toronto. In addition to acting as an obstacle in the way of direct communication, these depressions diverted all traffic southward toward

two years allowed for completion under a bonus-penalty system. The Bloor section is entirely filling and possesses no actual bridge building features.

The Don section naturally possesses

275,911 gallons in 1915. The decrease in tobacco consumption was less pronounced 3.329 pounds per capita being smoked as compared with 3.427 pounds the year previous.

# "Dilution" of Labor in Canadian Munition Plants

By Mark H. Irish, M.P.P.\*

*No record of Canadian industry during 1916 would be complete without special attention being drawn to the introduction of female labor into our metal-working plants, or, to be more specific, those of them engaged in the manufacture of shell and shell accessories. The following racy, yet comprehensive sketch of the initiation and progressive development of "diluted" labor in our midst will constitute more or less of a revelation to many of our readers—at home and abroad, while at the same time impressing them with the certainty of still more remarkable achievement to be looked for quite early in the New Year.*

**W**HEN the Ministry of Munitions in Great Britain indicated that a larger output of projectiles was needed and that a very important percentage of this increased requirement should come from Canada, the Imperial Munitions Board in this country was immediately aware that a factor in satisfying these demands would be labour.

with the view that the reduced manpower might not be a cause for delayed deliveries. The department frankly imitated the example set it in England, and has devoted its attention to the Dilution of Labour almost exclusively.

## Labor "Dilution" Defined

Dilution of Labour does not mean the substitution of a woman for a man, rather is it the spreading over either a greater time or a greater number of machines, the available men and, under charge of these men, placing women in their midst. For example:—If one hun-

one hundred women, the result being that one hundred men plus one hundred women produce quantity 2A. These figures, of course, are not perfectly ac-

MILLING ESCAPE HOLE, TOP AND BOTTOM RINGS, NO. 80 FUSE.

We in Canada had reached a stage at which we were experiencing the same shortage in the male labor market, owing to enlistment in the Overseas Forces, as the Old Country had faced a year and a half before. The Imperial Munitions Board, in this emergency, formed a Department of Labor and set to it the task of meeting the requirements of the various manufacturers

\*Director of Munitions Labor, National Service Board, Canada.

MILLING THE UNDERCUT IN STEM NO. 80 FUSE.

dred men can produce quantity A, then mathematically two hundred men can produce quantity 2A. We had not the second hundred men, therefore the first hundred men are "diluted" with

JOSEPH WESLEY FLAVELLE, LL.D.,  
Chairman Imperial Munitions Board.

curate because trial has proved that one hundred men plus one hundred women sometimes only produce quantity  $1\frac{3}{4}$  A. On the other hand, I am pleased to record that one hundred men plus one hundred women have frequently produced quantity  $2\frac{1}{2}$  A.

## A New Experience

When we remember that the metal working shop was a realm wherein woman had never stepped prior to the present war necessity, one must not be surprised that a change in conditions so revolutionary was not grasped with enthusiasm by either the manufacturer or his male employee. In passing, let me say, however, that the manufacturer faced with splendid courage the expense incidental to the adaptation of his factory for the reception of female help, and the trials and tribulations incidental to women first entering a machine shop. Also, let me pay a tribute to the loyal co-operation of the workmen concerned, actuated as they have been from the beginning, by a steadfast patriotic pur-

pose. It speaks volumes for the mechanic as a class that, up to the date of this writing, we have not experienced a single moment's delay of his making, in the effort at the Dilution of Labour.

The manufacturer first said::

NO. 100  
FUSE RING  
TURNING  
DEPT.

"Women cannot make shells." The pictures from England of the women at work in munitions factories only brought forth the statement that we did not have the same class of women in Canada. Finally, one contractor, operating upon the largest shell we make in Canada, which weighs several hundred pounds net, consented to a trial. Four weeks from the day he agreed to the change, he had several hundred women turning out the 9.2 inch high explosive projectile. All honour to this pioneer. All honour to the men who trained the women that first assisted munitions making in Canada.

When this example was complete, we again commenced our missionary tours, having now the advantage of a factory in actual operation with women, and open, as all factories are, to other munitions manufacturers to view and be convinced. We took many of them to this experimental plant and then their statement was:—"We cannot get the

women. How little we know of the Womanhood of Canada!" So as soon as it became, even in a very small de-

gree, public that women were wanted to make munitions, we were deluged with applications, so much so, that we had to appeal to the Government of Ontario, in which province the greatest number of factories are located, to open an employment bureau for the registration of the applicants and eventually, as the plants became remodelled, for their allocation. To-day, and the effort is not four months old, we have more than twenty per cent. of the factories engaged in operations suitable for women, employing them, and we have more thousands of women at work in this last week of December than we had hundreds at work the first week in October. It looks now as if the supply of female labour for munitions plants would only cease when the necessity has been satisfied, or if the satisfaction given by their employment would induce almost every manufacturer, where their services are suitable, to adapt his buildings for their reception and employment.

#### Welfare Features

In the smaller towns where the women had to be imported from the

DETAIL VIEW IN  
NO. 100 FUSE RING  
TURNING DEPT.

urban districts, there was at once experienced a shortage of accommodation. In this difficulty we appealed to the Young Women's Christian Association and they responded in a manner creditable in the extreme. Hostels were opened under

their supervision and management. where girls and women are housed and cared for amidst environments which enables us to say to every mother: "Let your daughter go, she will be well looked after."

In the large cities where the factories are located in the outskirts, where there were no restaurants or other suitable places in which women could obtain, even at exorbitant prices, light refreshments, we again turned to the Young Women's Christian Association and they have established, under voluntary effort, canteens in the factories, where

tion, and that everything connected with his establishment shall be wholesome, clean and generally conducive to the health and happiness of his women employees. While this has its moral side, it also has its material advantage. Such conditions are conducive to steady and contented work, with the consequent increase in output by the plant at large. We cannot commend too highly to those interested in the subject this welfare feature, the housing, the canteen, the rest room, hospital and all other adjuncts that go with perfection in the employment of women in industrial

view to keeping the hair from catching in shafting, belting or other machinery. The long shops with row upon row of lathes, each "manned" by a keen, alert, uniformed woman, is as inspiring as it is strange to Canadian life.

On the smaller parts where dexterity and nimbleness of finger is essential, the woman has excelled the man in efficiency. In work where a man's strength enables him to perform an operation without mechanical assistance but which is too heavy for a woman to handle in like manner, the man still prevails in point of rapidity of production. When, however, the woman and the man are both obliged to use mechanical assistance for moving the shell body, they become equal, and their output varies but slightly and, I am told, in favour of the woman.

The woman labour is being drawn not from other industries, as might have been expected, owing to the attractive rate of wage, but from the class, at least so far, which has worked before but presently found no necessity to continue. These women and their daughters have entered the factory again as a duty to the State. Their enthusiasm is unbounded. The majority of them have husbands, fathers, brothers or sweethearts at the front and they rightly feel that their position in the munitions factory has joined them to the force behind the man behind the gun.

#### IRON AND STEEL PRODUCTION DURING 1915

THE production of iron and steel in Canada during the calendar year 1915 is the subject matter of a bulletin just issued by the Department of Mines, Ottawa. Our iron and steel industry had made steady progress up till the end of 1913, when the record figures of 1,128,000 tons of pig iron and 1,168,000 tons of steel ingots and castings were reached. The year 1914 however, showed a considerable decline in output of the furnaces. The railroads which are large consumers of steel, ceased generally to enter upon new construction work, confining their purchases of rolling stock to what was just necessary to maintain the efficiency of their services during a period of slackened trade. When railways reduce purchases, other industries generally follow suit.

In 1914 the production of pig iron fell to 783,000 tons and that of steel ingots and castings to 828,000 tons. Last year (1915) was a year of recovery. The call for munitions of war created a demand for steel, which was helped by the impetus to general trade given by the great harvest. The pro-

ADAPTERS.

#### Service Badge Feature

We have also issued badges to the women workers after steady employment in one plant for thirty days. These badges are supplemented with a service bar after the em-

HANDLING 8 IN.  
SHELLS FOR  
MACHINING.

all the female employees can secure tea, coffee, milk, sandwiches, pastry, and sometimes sweetmeats. These canteens perform a work aside from and above the mere supplying of food at cost and of the most wholesome quality; they provide a refuge for the woman in the factory where she receives the sympathetic and helpful encouragement of the voluntary Y. W. C. A. worker, and many a kindly act could be recorded connected with this welfare effort.

We insist that there shall be employed by the manufacturer a matron and that he shall supply rest rooms, suitable cloak and lavatory accomoda-

tion, and that everything connected with his establishment shall be wholesome, clean and generally conducive to the health and happiness of his women employees. While this has its moral side, it also has its material advantage. Such conditions are conducive to steady and contented work, with the consequent increase in output by the plant at large. We cannot commend too highly to those interested in the subject this welfare feature, the housing, the canteen, the rest room, hospital and all other adjuncts that go with perfection in the employment of women in industrial

ployee has retained the same position for six months. The badges are highly prized as indicating that the wearer is doing her "bit" in the prosecution of the war. All the women wear a uniform style of "overall," which are purchased by the manufacturer in large quantities and sold to the worker at cost. Part of this equipment consists of a head cover, like a bathing cap, designed with a

duction of pig iron rose to 913,000 tons, and of steel ingots and castings to 1,012,000 tons. When the figures of the present year are available, it will be found that the record of 1913 has been surpassed. During 1916, there has been a still greater demand for munitions material, while both for home and foreign railways there have been orders for cars on a large scale, and experiments and developments in the way of modern ship construction give promise of creating a new market for the output of home furnaces.

#### Provincial Production of Pig Iron

The production of pig iron in Canada is confined to two provinces, Ontario and Nova Scotia. Quebec from the time of the early French days had furnaces which, through the processes followed, turned out a quality of iron second only to that of Sweden. The yearly figures, however, were never large. The greatest, 11,000 tons, are credited to 1904. Since 1911, the furnaces have been dead. Nova Scotia, whose furnaces are at Sydney, in 1915 produced 420,000 tons, and Ontario, which has its larger furnaces at Hamilton, Sault Ste. Marie, and Port Colborne is credited with 493,000 tons. The value of the whole was \$11,374,000.

The ore used was largely imported. Iron ore is widely distributed in the Eastern Provinces. From peculiarities of composition, the situation of the deposits, or the relatively small percentage of iron carried, it has not been found practicable to use much of the home product in home furnaces. Nova Scotia and Quebec, like British Columbia, have in the past figured in the list of producing provinces. They have nothing credited to them in 1915. New Brunswick produced 3,600 tons, and Ontario 394,000 tons of the total of 1,463,000 tons charged to Canadian furnaces in 1915.

The chief mines in Canada are the Helen and Magpie, in the Lake Superior region, operated by the Algoma Steel Corporation. Extensive electrical development at Steep Hill Falls supplies the power for working the mines. From the Helen mine in 1915 there was shipped to Sault Ste. Marie 205,000 tons of hematite, averaging 50 per cent. of iron. This mine has since 1900 produced 2,535,000 tons of ore, and over 42,000 tons of iron pyrites. Shipments from the Magpie were 132,000 tons of roasted siderite, carrying 50 per cent. of iron.

The great dependence of the iron producing industry in Canada for ore is on Newfoundland, from which last year 789,000 tons were imported, and the United States, where 715,000 tons were obtained. On the other hand there was exported in 1915, 79,000 tons of

ore, including 48,000 tons sent to the United States.

#### The Industries Still in Infancy

The iron and steel industry in Canada is yet at its beginning. Pig iron and steel billets are the raw materials of a great variety of manufacturers. From the furnaces the product goes in great part to the rolling mills, which in 1915 turned out 232,000 tons of steel rails, 124,000 tons of wire rods, 264,000 tons of plates, sheets and bars, and 34,000 tons of other products. These, and the articles into which they entered as materials for other industries, constituted \$14,391,000 of the exports of Canada in 1914, and \$48,268,000 of those of 1915, some \$30,000,000 of the latter amount being due to demands of temporary character. The imports of iron and steel and their products in 1914 were valued at \$80,063,000, and in 1915 at \$74,308,000 from which it will be noted that there is considerable opportunity for expansion to meet home market demands.

#### BURLINGTON STEEL CO. YEAR

DURING the past year the rolling mills of Burlington Steel Co. plant at Hamilton, Ont., have been operating 24 hours a day, the capacity at present being 40,000 tons of steel bars per annum. The output consists of all types of bars for reinforcing concrete, angles and flats for the manufacture of agricultural implements, and various sections for almost every commercial and industrial requirement. The mills are electrically operated, calling for between 2,000 and 3,000 horse-power. The mill installation consists of a 7-stand, 12-inch unit, and a combination 8-inch unit for small material.

In addition to the production of steel bars, the manufacture of 4.5-in. high explosive shells has been in progress during the year, an order for 25,000 having been already completed. Business during 1916 has expanded very considerably, a nice export connection having been formed with France and Australia, and further substantial orders from these countries are meantime being negotiated.

#### STEEL PLANT FOR PACIFIC COAST

FOR some weeks, W. H. McLaws and G. A. Mackenzie, of Calgary, were in Vancouver looking over probable sites for the establishment of a plant for the manufacture of steel. These gentlemen are president and managing director respectively of the Canadian Western Steel Co., of Redcliffe, Alta., and the Alberta Rolling Mills, at Medicine Hat. A site consisting of ten acres has been secured at Eburne, at a cost of \$14,000,

and, upon this, the construction of a steel plant, the initial cost of which will be about \$250,000, will be begun early in January. Ultimately, employment will be given to three hundred men.

The buildings will cover four acres, and, when production starts, the necessary pig iron will be procured from China, owing to the war demands on same in Canada and the United States. Ultimately, it is proposed to erect a smelter and treat ore, which is to be found in considerable quantity in the Province of British Columbia. Bolts, screws, angle iron, nuts, bar iron, and, later on, steel plates, will be manufactured. Mr. McLaws was formerly a member of the Calgary legal firm of Lougheed, Bennett, Allison & McLaws.

#### CANADA'S NICKEL OUTPUT

THE value of the nickel production of Canada in 1916 is estimated at \$23,000,000, against \$20,423,348 in 1915, and \$13,655,381 in 1914. Ten years ago the valuation was \$8,948,834 and in 1896 it was \$1,188,990, but only \$498,286 in 1889. In the first half of 1916 the output was 42 per cent. greater than for the corresponding period in 1915.

The first and largest producer of nickel in the world is the International Nickel Co., which does its refining in New Jersey, but produces matte at Sudbury, Ont., through the Canadian Copper Co., which it controls. Another corporation is the Mond Nickel Co. of Great Britain, of which the head is Sir Alfred Mond. This company smelts its ore at Coniston, Ont., and the matte is refined at Clydach, Wales, the plant having been greatly enlarged in 1914. The International Nickel Co. shipped 59,000,000 lbs. to the United States in 1915, and the Mond Co. sent 12,000,000 lbs. to Great Britain. Each company uses its own process, developed after extensive experimenting and great expense.

A third corporation was organized in July, 1913—the Canadian Nickel Corporation—but the name was afterwards changed to the British-American Nickel Corporation. The British Government will take part of its output and will guarantee its bonds. Undoubtedly this is part of a plan to increase the supply of nickel for the Government without dependence on foreign countries. Not long ago it was announced that very soon actual operations on the building of another refinery for the British-American Co. would begin, and that the new refinery of the International Nickel Co. at Port Colborne, Ont., would be turning out refined metal within 12 months. The work of the British-American Co. will be directed by E. P. Mathewson, who has recently left the Anaconda Copper Mining Co. to associate himself with the new undertaking.

# Relation of Canada's Universities to Her Industries

By W. L. Goodwin, D.Sc. \*

*Not the least notable feature of the war to date, and relative especially to its further successful prosecution, has been the response of the personnel of our Empire scientific institutions, colleges, and universities, to the call for co-operative effort with the factory and the field. Attention has, therefore, naturally been again, and perhaps more forcibly, directed to the kinship that should exist between the University and the workshop in peace-time as well as war-time. Inspiration to greater effort towards that end is available in this article.*

THE prosperity of a state depends, not so much upon its natural resources, as upon the efficiency of its citizens. That this is the case has been proved in the history of many states—some, like the Dutch, wresting prosperity from the most unpromising circumstances; others, like the Mexicans, remaining poor in the midst of Nature's bounties. Efficiency depends upon knowledge, and intelligence to use it to the best advantage. For the highest efficiency the knowledge must be complete for the purpose, and up to date. Intelligence implies such development of the brain power as is necessary in making use of knowledge; but it also includes character—a quality of spirit which leads to conscientious work. It must not be forgotten, too, that there is an intelligence of the body, as well as an intelligence of the mind; and both must be cultivated by the processes of education, if the citizens of a state are to be completely efficient. The universities offer opportunities for the most complete acquisition of knowledge and the development of the best intelligence. If they truly discharge their functions they will provide leaders for all the activities of the country.

## The Meantime Situation

In discussing the relation of Canadian universities to manufacturing and other industries of our country, it will be well to inquire in the first place how far they have gone towards fulfilling the ideal thus set forth. During the past twenty-five years our universities have very largely increased the facilities for giving young Canadians good courses of study to qualify them for the various branches of engineering and other pursuits resting upon science as a foundation. It can be justly asserted that the universities have kept abreast of the demand for highly trained men of this class, and in the case of some branches of engineering they have turned out graduates rather faster than Canadian industries have absorbed them. A considerable proportion of the best of our science graduates have found positions in the United States and other foreign countries. In the meantime, at any rate, their services are lost to Canada. Of

the graduates who have found their place in this country, an increasing proportion are managers of manufacturing and other industrial concerns; while others hold responsible positions implying the quality of leadership. While, however, the universities have fully met the demand for such specially educated men, it does not follow that industrial concerns have employed, or are now employing as many of these men as a wise and progressive policy calls for

## The Instruction Provision

Passing in review the principal Canadian universities as to what they are doing in training men for the industrial pursuits, we find that in Nova Scotia the Technical College in Halifax offers courses in the different branches of engineering; in New Brunswick, the University of Fredericton graduates men in Civil Engineering; in Quebec Province, McGill University, in Montreal, has a strong Faculty of Applied Science; in Ontario there are two universities with complete science faculties—viz., the Provincial University in Toronto, and Queen's, in Kingston; in the Western Provinces, the universities, although quite young, have already organized faculties of science, and are paying special attention to agriculture.

There are several smaller universities and colleges which are doing good work in scientific education, and in taking stock of our resources in men for carrying out any scheme of research and co-operation with industries, these institutions should not be overlooked. There will be found in them men of ability and scholarship who only need the opportunity to do good service for Canada. In addition to these educational facilities, a number of the provinces have well-developed agricultural colleges—e.g., McDonald College, in Quebec; Guelph Agricultural College, in Ontario, and the Manitoba Agricultural College, near Winnipeg. There is also an agricultural college in Nova Scotia, and the Universities of Alberta and Saskatchewan have opened departments for higher education in agriculture. There are also several technical schools, which, while not of university standing, yet should be mentioned as providing a scientific education much in advance of that which can be had in the ordinary type of secondary schools. Good examples of this

class are the finely appointed Technical School in Toronto, and L'Ecole Polytechnique, in Montreal.

Altogether, it may be maintained that Canada has made a good beginning in providing for her sons' education of the university grade, to fit them for the higher positions in manufacturing and other industries. All these institutions of learning, whether supported by the provinces or by private endowments, are more or less hampered by lack of funds. It seems that we are not yet fully awake to the fact that money spent liberally for this purpose is a first-class investment for the country. Science is organized, up-to-date knowledge, and applied science is that knowledge used in the industries. A country in which industrial concerns are in the hands of men who are not in possession of such knowledge is evidently handicapped and must surely fall behind in competing with countries using all the resources of science.

## Tackling of New Problems

For industrial purposes it is not enough to call to our aid the knowledge which has already been brought to light. New problems are constantly arising, requiring for their solution the application of scientific principles. Improvement in processes, the discovery of new processes, the reduction of costs by increasing the yield, the utilization of waste materials, the discovery of new materials—all these are subjects of investigation by men trained for the purpose. The universities should provide such men, and their education should be of a kind to commend them to managers of industrial concerns, who, in their turn, must have their eyes open to the fact that, unless they in this way make use of the best obtainable knowledge and skill, they must inevitably fall behind.

There is no more clearly demonstrated fact in the modern business world than this. It is quite possible that the universities are in part to blame for the slowness with which this idea has been accepted and acted upon by managers of industries. Courses of study and the general college atmosphere and discipline are not always calculated to cultivate the habits or the point of view which fit a man for the real business of life, but it may be safely stated that on the whole the science graduates of Can-

\*Dean, School of Mining and College of Applied Science, Queen's University, Kingston, Ont.

adian universities are a fairly business-like lot of men. What is particularly needed just now is a closer co-operation between the universities and the industries—a co-operation which may take a number of useful forms.

### Forms of Industrial Co-operation

(1)—Some arrangements by which the students should spend part of the year at college and part in the factory, mine, or other scene of practical activity, and thus carry on at the same time the gaining of practical experience with advance in the college course. This is done in a scattered informal way by many students. What is needed is a system which would take in every science student of every university. In this way managers would always have passing under their eye young men from among whom they could choose those especially adapted to their business; and, on the other side, the young graduates would have already the introductions and chances for a start which they sometimes find it hard to get.

(2)—Co-operation in research would lead to results good for both parties. It would provide stimulus for the professors and advanced students; and, on the other side, it would give the industries the assistance not of one man, but of a whole staff of scientific advisers. There are great possibilities here. But it implies two things:—First, an increase in the staff of the universities so as to lighten the burden of teaching. In this way the professors will have more time to give to investigations. Second, a system which will connect the universities and the industries in such a way that problems will be handed over to the universities for solution as a matter of course. In countries where industries make full use of modern science, the great manufacturing corporations have in their employment large numbers of men who devote their whole time to research. This is the ideal which we should choose for Canada. There will always remain many smaller concerns not strong enough, however, to afford research laboratories of their own. Even in the most advanced countries it will always be found difficult to maintain between university and factory the close connection described.

(3)—There is a third way in which the universities could usefully co-operate with the manufacturers—viz., by an interchange of lecturers—the university professor going to the factory to talk to the staff about the newest development of science in their line, and representatives of the manufacturing factories lecturing to the students and professors on the applications of science. The writer has before him a letter just received from one of the great manufacturing corporations in the United States, signed by the Secretary to the Committee on Relations with Educational Institutions. This letter

shows that arrangements are being made for such an interchange of lectures. Our motto in Canada for university and factory should be: "Let us get together."

To sum up—Both our universities and our industries will benefit by a closer co-operation, the manufacturers strengthening the universities: (1)—by employing more of their graduates; (2)—by giving students vacation employment; and (3)—by sending to the universities manufacturing and other problems for solution, and by providing the necessary assistance through scholarships and fellowships; The universities increasing their usefulness to the industries: (1)—by studying more thoroughly the needs of the country and shaping their educational work accordingly; and (2)—by cultivating a closer acquaintance with existing industries.

### Government Enterprise Necessary

Outside of all this there is a ground which can be covered only by Government enterprise. An example of this is the manufacturing of nitrate from air—a great undertaking of national importance to agriculture, to chemical industries, and for the manufacture of explosives for war. There are many developments of natural resources which, like this, can best be undertaken in their initial stages, at any rate, by the Dominion Government. The scientific basis could, however, be most advantageously worked out in many cases at the universities, where the co-operation of a whole staff of scientific men could be secured. The first step towards this has already been taken by the appointment of the Commission on Industrial Research, the terms of appointment of which include co-operation with the universities. The wisdom of this course is almost axiomatic, as it is obviously best to use to the utmost the men and organizations already existing for the purpose.

### COAL AND STEEL IN NOVA SCOTIA DURING 1916

By F. W. Gray, M.I.M.E.\*

THE progress of the Nova Scotia coal industry may be gauged from the following figures of production (gross tons), covering the ten-year period ending 1916. The figures for the latter year are closely approximate:

1907	5,775,503
1908	6,076,330
1909	5,106,135
1910	5,817,109
1911	6,362,099
1912	6,995,289
1913	7,263,485
1914	6,650,038
1915	6,630,000
1916	6,170,000

\*Dominion Steel Corporation, Sydney, N.S.

### Production Variation

The natural progress of coal production was interrupted and hindered in 1909 by the numerous strikes occasioned by the abortive efforts of the United Mine Workers of America to gain a footing in Nova Scotia, and to oust the existing local miners' organization. The maximum production of Nova Scotia was reached in 1913, but the record figure of a little over 7¼ million tons attained in that year did not represent the maximum capacity of the Nova Scotia coal mines for output at that time, as a decided trade depression manifested itself about the middle of the same year, and the collieries did not work full time during its last quarter. It may be considered that the maximum output capacity of the collieries was about 7½ million tons. A production of 6,170,000 tons in 1916 is, therefore, 1¼ million tons below the maximum productive capacity of the Nova Scotia collieries.

In a time when the necessity for increased production of raw materials is being preached by the responsible statesmen of every belligerent nation, this very considerable diminution in the output of our most important raw material is sufficiently serious, particularly when the low figures of 1916 follow large recessions in output during the preceding years 1914 and 1915. A more serious aspect, however, is the probability that the tonnages of 1917 will show a still further decline to a figure between 5½ and 5¾ million tons.

### Production Decline Factors

A combination of circumstances is responsible for the decline in production. Foremost and chief among these is the loss of 5,000 colliery workers by enlistment for service at the front, and the fact that a preponderating proportion of these enlistments has been from among the skilled underground workers. It is everywhere admitted that the miner makes an excellent infantry soldier, and his willingness to do his bit, and more, has been in evidence throughout the Empire. The colliery districts of Nova Scotia were for a long time the happy hunting ground of the recruiting sergeants, who flocked into the mining villages to recruit men for units, having their headquarters as far away as New Brunswick and Quebec.

During the past year recruiting activities have been restricted throughout the colliery districts, but unfortunately the paramount necessity for coal was not recognized by the authorities until the output capacity of the collieries has been irremediably crippled for the further duration of the war, and even yet the men who are helping in the manufacture of munitions by digging coal have been granted no official recognition of their usefulness. If the miner is not a munitions worker and entitled to an official

badge, who is? He produces the basic, indispensable, essential munition of war, without which not a wheel could turn, and failing which neither men nor shells could reach the fighting fronts.

Other factors tending to restrict production are the practical cessation of expenditure on new developments since the spring of 1913, and the increasing physical difficulties attendant on the mining of coal in Nova Scotia, such as increased depths of extraction, increased proportion of coal won from submarine territory, lengthened haulages, and an unfortunate succession of underground fires at the mainland collieries that have considerably restricted production. All these causes, however, are to-day subordinated to the shortage of skilled miners, and no amount of new development or capital expenditures will permit of an increase in the output of coal until "the boys come home."

#### Wages and Materials Cost Increases

The year 1916 has seen a succession of wage increases granted in quicker rotation and more substantial in amount than in any previous comparable period in the history of coal mining in the province. Increases aggregating 25 per cent. have been given within dates less than six months apart. The cost of materials has increased in similar proportion, and transportation charges are so high as to approach absurdity. Yet while these increases in wages and cost of materials have within the past twelve months become so extraordinary as to attract general attention, the steady increase during the past ten years probably represents a more permanent and serious problem than the temporary unsettling of markets and prices by war conditions. During the past ten years wages have increased about fifty per cent., and the cost of materials entering into colliery operations, such as timber, oils, steel and iron goods, horses and horse feed, explosives, building materials, etc., has increased from 50 to 150 per cent.

#### Legislative Enactment Features

In addition to the enhancement of the cost of mining that arises out of that unhappy and universal subject of debate to-day, usually referred to as the high cost of living, there have been legislative enactments in recent years that have caused increments in mining costs. The rate of royalty was raised by the Government in 1913 from 10 cents to 12½ cents per ton, and workmen's compensation laws will be responsible in 1917 for an addition of not less than 4 cents per ton on the cost of mining.

In spite of these serious additions in practically every department of coal mining, the selling price of coal at the pit mouth has not materially changed. It is quite true that coal is now costing the

ultimate consumer more money, and that there have recently been considerable advances in price in the large cities, but a large portion of these advances is represented by increased charges for transportation, and an additional increment of cost between the coal dealer and the consumer. The net increase to the operator is small and disproportionate to the increase in the cost of producing coal. By the introduction of modern power plants, electric motive power, mechanical methods of coal-cutting, improved haulage systems underground, the utilization of all refuse and inferior coals and slacks, the recovery of by-products and generally more efficient methods, the coal operators of Nova Scotia have endeavored to combat the tendency of the cost of mining to increase by reason of the operation of the physical and economic causes above related, but the meagre increase in the selling price of coal at the pit mouth has not permitted the coal operator to reap the legitimate reward of his enterprise and foresight.

It is, therefore, quite evident that the future will of necessity see a considerable and permanent increase in the selling price of coal in Nova Scotia. The margin of profit available to the coal owner there has never been sufficiently large to enable proper provision to be made for amortization of capital expenditures, or to allow of the accumulation of sufficient financial reserves to carry the smaller companies through periods of financial stress.

#### Increased Coal Consumption

The great demand for steel has caused a largely increased consumption of coal in the various processes of iron and steel manufacture, and when this has been coincident with a diminished output and a sharp demand for bunker coals f.o.b. at home ports, it has resulted in a marked decline in the amount of coal available for the St. Lawrence markets. The exports of Nova Scotian coal to St. Lawrence ports in 1916 was only one-quarter of the normal annual shipments, and indications are that next summer not even this quantity will be available. The result is a pronounced increase in the importations of United States coal, at prevailing high prices of transportation and initial cost, and the loss to the Nova Scotia operators of a market that it has cost much effort to cultivate.

From the national point of view the increased revenue of the Customs Department is scarcely sufficient to offset the foolishness of spending millions on the purchase of United States coal at the same time that the Canadian coal production is steadily dropping. The effect on our national finances is tantamount to raising a loan in the United States at high rates of interest, and it adversely affects both our money ex-

changes with New York and our national earning power.

#### The Steel Situation

The steel industry of Nova Scotia seems at last to have come into its own. The present prosperity may be evanescent, and a passing result of the demand for munitions, but there are certain factors of permanence that have always existed in Nova Scotia, and which will, as years go by, steadily assume greater importance. These factors are the presence of large and practically limitless coal areas, the proximity of ample limestone supplies, and the facilities which the roomy harbors of Cape Breton Island, particularly the harbor of Sydney, afford for the cheap assemblage of raw materials and the receiving of the iron ore from the unique deposits at Wabana. The valuable character of the practically unlimited supplies of coal, limestone and iron ore that are controlled by the two large steel companies of Cape Breton Island have long been recognized by those acquainted with them, but it is only recently that the significance of them appears to have dawned upon the general public.

For a time, however, the Prince seems to have come into his own, and steel is being manufactured to-day in Cape Breton at a hitherto unprecedented rate. Some indication of this is the fact that the Dominion Iron & Steel Co. is daily producing 10,000 shell blanks of various diameters, in addition to the usual production of wire, wide rods, nails, etc. Large extensions are under way or in contemplation at the works of both the "Dominion" and the "Scotia" Companies. A new blast furnace is approaching completion at Sydney Mines, and, at Sydney, extensions contemplated include new furnaces, additional coke ovens, additional soaking pits, and additional equipment sufficient to double the present production capacity of the "Dominion" plant.

The future no man can tell, but an intelligent anticipation of coming events is permissible even in these days of the disrepute of prophecy. Whether, therefore, the present activity of the steel trade in Nova Scotia, admittedly due to war demands, will decline when peace shall come, is a problem that every man must decide according to his ability, but some day or other, sooner or later, the permanent economic advantages possessed by Sydney will place its steel industry in a pre-eminent and unassailable position. With the memory of past hard times before them, it is fair to assume that those who are directing the coal and steel industries of Nova Scotia will take advantage of the opportunity offered by the present brisk demand to improve and put the plants into first-class condition and to provide the financial reserves required for the coming "rainy day."

# Review of the Past Year's Iron, Steel and Metal Markets

## Staff Article

*A year ago we stated that prosperity was rampant so far as the production of iron and steel was concerned, and only in slightly lesser degree was the like condition true with regard to the more prominent metals. The year now closing has added materially to the prosperity of its predecessor, a circumstance due almost entirely to the insistent and ever-developing demand for munitions by Great Britain and her Allies. The charts, together with the accompanying data amply evidence the altogether abnormal situation above indicated.*

### IRON AND STEEL

**T**HE unusual activity which prevailed in the iron and steel trade in Canada at the close of 1915 has been continued during the year just closing only to a far greater degree. There never has been in the history of the trade such a year of unexampled prosperity as during 1916. All records have been broken both as regards prices and tonnage output, and the coming year bids fair to eclipse the 1916 record in every way, as far as can be judged at the present time. The situation is due almost entirely to the enormous demand for shells, although there has been considerable export business done in wire rods and wire products. The output of the steel companies has to a large extent been at the disposal of the Imperial Munitions Board, and for this reason a comparatively small tonnage has been available for purposes other than munitions. The development of export business in steel products which was widely discussed during 1915 has been held up indefinitely for reasons above stated, and it is doubtful if the question will be reopened until the present urgent demand for shells has been satisfied.

### Increased Output Provision

One particularly satisfactory feature has been the ability of the steel companies to largely increase their output in view of the famine in steel which threatened towards the end of last year. Although there is now a decided shortage of steel, it cannot be said to approach a famine in the general acceptance of the word. If, however, a famine had developed, the results might easily have been serious in view of the enormous tonnage required for munitions. Considerable credit is therefore due to the steel companies and the Munitions Board for the way in which they have handled the situation. The shortage of steel is of course general, but fortunately is not affecting the production of munitions as this industry has the first call on the output of the mills. In other respects however, the shortage is serious and the increase in values of practically all iron and steel products, semi-finished and finished, has been the natural result. One effect of this short-

age has been the partial and in some cases complete suspension of building operations while many industrial plants using iron or steel in the manufacture of their products have been badly handicapped and their output restricted in volume. Very little relief has been obtainable from the United States, as the mills there are as badly congested as our own plants. Canadian dealers having contracts with American mills were for a time in a better position, although the advantage which they enjoyed in the early days of the boom has now practically disappeared. The shortage from U.S. sources has been felt to a greater degree perhaps than that from Canadian mills, particularly as regards structural shapes and ship material.

### Plates

The marked decline in building, and consequently less demand for structural shapes relieved the situation to some extent. During the year however, there was an important revival in the shipbuilding industry affecting every ship-building yard in Canada; a rush for ship plates accordingly resulted. Prices of plates had already reached a high level and deliveries were so backward that shipbuilders have only been able to obtain material by paying premium prices. It was only by reason of the urgent demand for tonnage that shipowners were able to pay the increase in cost of construction. The present cost of plates and the great difficulty in obtaining them is tending to restrict for a time, further development in the shipbuilding industry. Plates have made a gain of  $2\frac{1}{4}$ c per pound during the year.

### Rails

During the year a scarcity of steel rails developed. The railways, during the year and also in 1915, had purchased comparatively small tonnages of rails owing to the policy adopted of keeping down expenses to a minimum. Only one concern, the Algoma Steel Co., kept their rail mill in operation. The Dominion Steel Corporation who also roll rails used their entire output of steel for other purposes. The C.P.R. has already shipped a quantity of old rails from sidings, etc. to France for military railways, while arrangements

are now being made for further large tonnages of similar material to be sent overseas. Little relief was obtainable from the States owing to the oversold condition of the mills there and very backward deliveries. The situation continues to become more acute with no sign of relief in sight. During the summer the price of rails advanced \$5 per ton from \$28 to \$33, the first price change in 12 years. Later they were advanced to \$38 per ton f.o.b. mill, which is now the ruling price. The advance created some sensation in the market but was inevitable under the circumstances.

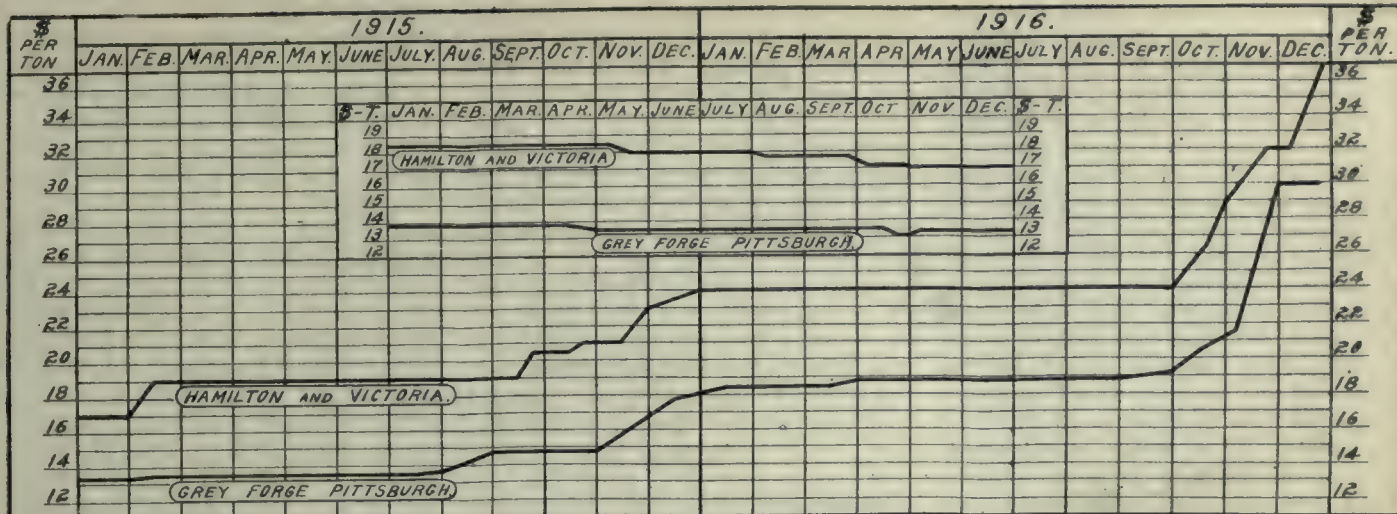

### Pipe and Tubes

Prices of tubular goods have advanced rapidly during the year and like all other steel products have attained record levels. With regard to boiler tubes, conditions in the U.S. market have affected the situation here rather than any influence in the Canadian Market. The demand for merchant and boiler tubes in the States has been so heavy that the mills are sold up for practically twelve months and prices consequently are high. The situation in wrought pipe differs little from that in tubes although the increase in cost of raw material is the principal reason for the prevailing high prices. Boiler tubes are now 100 per cent. higher on an average than at the beginning of this year.

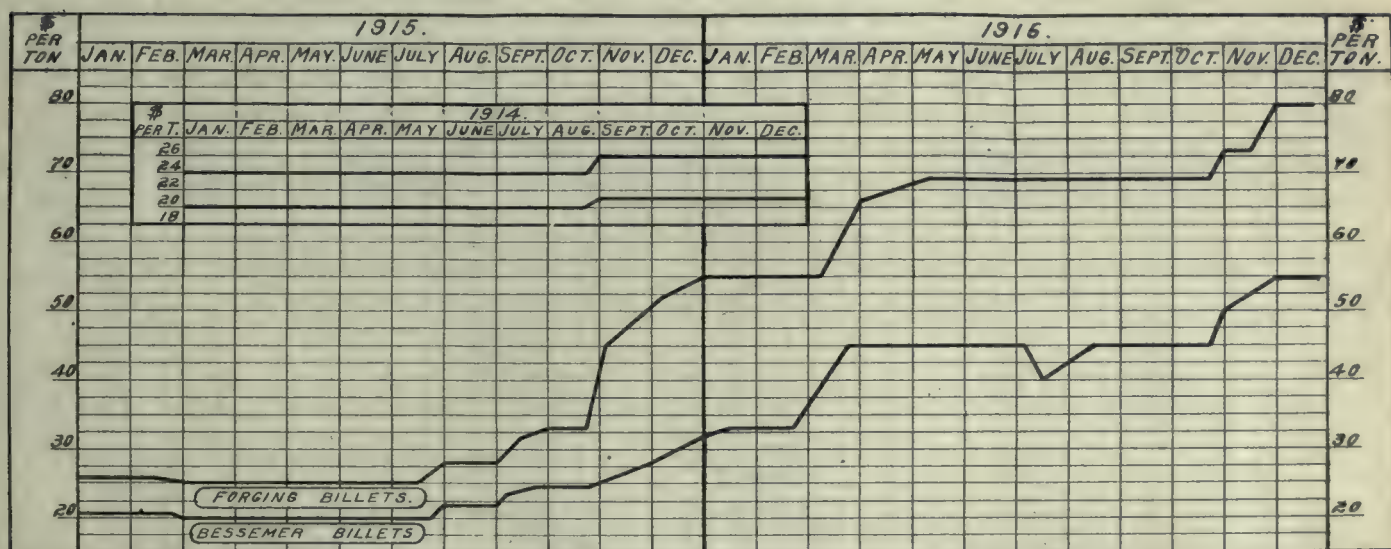

### Sheets

The market for black and galvanized sheets has been very firm throughout the year and prices have been steadily advancing. In black sheets Canada is now entirely dependent upon the United States for supplies, and conditions there consequently affect the situation in this market. The demand in the primary market, during the year has been good, and sheet mills have for the most part been behind on deliveries. A shortage of sheet bars has on more than one occasion tended to restrict production which has usually been accompanied by an advance in prices. Towards the end of the year the situation became more acute, sheet bars became scarce and higher, while shortage of fuel and labour also hampered operations at the mills. Prices of galvanized sheets have, of course, been materially affected by

PRICE FLUCTUATIONS OF PIG IRON DURING 1914 (INSET), 1915 AND 1916.

PRICE FLUCTUATIONS OF FORGING, AND BESSEMER BILLETS, DURING 1914, 1915 AND 1916.

PRICE FLUCTUATIONS OF BOILER PLATE ( $\frac{1}{4}$ " TO  $\frac{1}{2}$ " ), AND STEEL BARS DURING 1914, 1915 AND 1916.

the high cost of black sheets, while the consistent high price of spelter has also helped to keep prices up. The high cost of materials, principally spelter, has had the effect of considerably curtailing production of galvanized sheets, and the demand also fell off during the year. Some makers reduced their output by 50 per cent. and others even more. Owing to the war, the importations of British made sheets have been light and quotations have been largely nominal. The trade has been and still is in an unsatisfactory condition owing to the high cost and scarcity of all raw materials and the uncertainty of the spelter market. Black sheets have made a gain during the year of approximately \$1.50 per 100 lbs. while galvanized sheets are about \$1.25 per 100 lbs. higher than at the beginning of the year.

### Bar

Prices of iron and steel bars have advanced steadily during the year from

steel, such as billets, sheet bars and wire rods, the shortage of these having been more apparent than in any other steel products. On more than one occasion the situation was acute, but nothing developed of a more serious nature than a jump in prices. Bessemer and open-hearth billets and open hearth sheet bars started the year at \$32 a ton, they are now quoted at \$55 a ton. Forging billets which were \$55, are now \$80 a ton, while wire rods have advanced from \$40 to \$70 a ton, all Pittsburgh prices. The Canadian mills making billets are absorbing their entire production for shell and other purposes.

### Pig Iron

During the latter part of the year, the activity in the pig iron market has been the outstanding feature. It is somewhat remarkable that, although steel has been steadily rising all the the year, it was not until September that pig iron began to move. For nine

paratively light demand for foundry pig, otherwise the situation would have been very acute in the foundry business.

The upward movement in prices started in September at which time the two principal domestic irons were quoted around \$24 a ton, this price having been current since the beginning of the year. When the movement got under way, the market seemed to go wild and prices advanced rapidly, the \$32 mark being reached early in December. Shortly afterwards all quotations were withdrawn but based on U.S. prices \$38 is about the market value at the close of the year. It will thus be seen that prices of pig iron have advanced more rapidly than at any time in the history of the trade, all previous records have been broken. The movement in Canada of course followed the activity which originated in the United States where prices advanced in a most extraordinary manner, being now approximately \$12 higher than early in Sep-

PRICE FLUCTUATIONS PER 100 FT. OF 3 1/2 INS. SEAMLESS AND LAPWELDED BOILER TUBES, DURING 1915 AND 1916.

2.75c to 3.75c per lb., a clear gain of 1c. Several times during the year makers have withdrawn prices on bars, this being always followed by an advance. Deliveries on steel bars have been getting more backward all the time with the result that iron bars are now being offered instead of steel owing to the quicker delivery on the former. Prices are to some extent nominal as quotations given are for delivery at mill convenience which may be anywhere from nine to twelve months. Bars 2 in. and larger quoted at 5.25c base, have also made a substantial advance since the beginning of the year. The bar production is notable this year in that it has been confined almost entirely to meeting the demand for shrapnel bars.

### Billets

The biggest gain in prices during the year has been made in semi-finished

months, pig iron relatively with steel was getting further behind, notwithstanding the big demand for steel-making pig irons. At the close of the year, pig iron is not so very far below steel and is getting more into line with steel prices. The pig iron market in Canadian is rather restricted as all the big steel companies make their own pig, and in normal times have more than enough for their own purposes. There was therefore in ordinary times considerable tonnage available for grey iron foundries and prices consequently were reasonable. As the demand for steel increased, foundry iron gradually became scarcer and eventually up went prices. The most important independent furnace formerly producing foundry iron exclusively, is now turning out basic iron for steel making which has intensified the shortage of foundry grades. There has only been a com-

tember. Stocks of pig iron at the furnaces were soon depleted and orders now on hand will take several months to fill. To make matters worse, transportation difficulties have hindered the movement of coke to the furnaces, and the winter weather will aggravate the situation. Only recently it was feared that the Hamilton, Ont. furnace would have to shut down owing to the shortage of coke. Although the coke production has increased, it is barely keeping up with the demand, while, in addition, there is a shortage of cars making the situation a difficult one to handle. There is ever present a possibility of a short supply for the furnaces.

### Production Increases

During the year the steel companies have made important extensions, and the physical condition of the plants has been greatly improved. New open-

hearth furnaces have been constructed and rolling mills extended. The capacity output at our steel concerns is now greater than it ever has been, and the profits which have undoubtedly been made, have placed the companies in a

an important addition to the steel producing facilities in Canada.

#### Future Uncertain

How long the prevailing prosperity in the steel industry will last is a debat-

down. Prices have reached a dangerous level and a sharp slump is not desirable. A note of warning is thus not out of place. That prices will go still higher is quite possible particularly on certain steel products where there is a

PRICE FLUCTUATIONS OF ONE-INCH WROUGHT IRON BUTT-WELDED PIPE, DURING 1915 AND 1916.

sound condition, financially, and have put the steel industry figuratively speaking on its feet. The effect of this will be felt more in normal times when the demand is lighter and competition keener. It is to be hoped that when the present rush is over some effort will be made to establish a plant or plants for rolling structural shapes and plates for which there will be an increasing demand in Canada. This country has so far been entirely dependent upon the States for plates and for all shapes, except small angles, etc. Now seems the time to give the matter some consideration so that the work can be proceeded with when the opportunity arrives. During the year some progress has been made on the new steel plant at Ojibway, Ont., which when completed will make

able question. Until quite recently, twelve months was a fairly easy guess, but Germany's peace proposals, although promptly rejected, have served to remind people that it is almost entirely due to the great war that the industry is booming. It is true that the mills have all the business they can take care of for almost a year, but if by any good stroke of fortune, cessation of hostilities came within the next twelve months, then a part of that business would almost certainly be cancelled. Of course the tonnage might be taken out in some other form than shell steel, but conditions arising after peace has been declared will be discounted before this actually happens. It is just here that prices are liable to be affected before the activity at the mills slows

decided shortage, but it is likely that the market has received a wholesome check in the meantime, and further developments in Europe will decide the swing of the pendulum.

#### METALS

THE metal markets have experienced another twelve months of war influence, but, generally speaking, they have not been quite so erratic as last year. The principal feature this year has been the big increase in volume of business, particularly in copper, which has reached enormous tonnages. The production of, so-called, war metals has increased greatly, and has assumed large proportions. New mines have been opened up and old mines reopened, while new refineries have been established to take care of the big increase in mines output.

PRICE FLUCTUATIONS OF 2 IN. LAP-WELDED WROUGHT IRON PIPE DURING 1915 AND 1916.

Although the largest percentage of the production of war metals still comes from the United States, this country has been the scene of remarkable activity, and the metal mining industry has developed in a corresponding degree. The

Considerable progress has been made in Canada in the metal industry. Copper and zinc refineries have been established at Trail, B.C., and the output, although not very important at the present time, is steadily increasing. The war has

market, which will have a tendency towards lower prices. The situation will likely be unsettled for some time previous to the actual cessation of hostilities and the market discounted before the war ends. Whether prices decline

PRICE FLUCTUATIONS PER 100 POUNDS OF GALVANIZED (PREMIER) AND BLACK SHEETS (28 GAUGE), DURING 1915 AND 1916.

production of copper has easily beaten all former records, the industry enjoying unparalleled prosperity. The output of lead and spelter in the United States is also much larger than in normal years owing to supplies from Europe having been cut off. For the same reason aluminum has reached record levels, large quantities having been exported to Europe instead of imported from there, as was the case before the war. Tin not being a war metal, has occupied rather a different position, and is the least likely of any metal to decline in value at the conclusion of the war. Antimony is a war metal, although not a very important one. At one time prices were very high, but this year there has been a sharp decline in value.

stimulated this industry, and in time no doubt all copper and zinc mined in Canada will be refined within her borders. At Port Colborne, Ont., the International Nickel Co. is building a refinery for treating nickel matte from the Sudbury district. There is also another concern who propose to establish a plant for refining nickel in Canada.

#### After War Situation

Although the German peace overtures have been rejected, there is still a possibility that before the end of 1917 peace will have been concluded or negotiations to that end finally begun. Although this may be an optimistic view, there is little doubt that during the coming year the possibilities of peace will be felt in the

gradually or rapidly depends upon developments in Europe.

That prices will decline after the war is a fair supposition, although to what extent it is difficult to say. The probability is that the price situation will have been adjusted to a great extent by the time peace is concluded. As far as can be seen the only metal that is likely to appreciate in value is tin, being essentially a peace metal. Copper will no doubt decline, but not to the same extent as other metals. The war demand will be replaced by a peace demand, which will doubtless be considerable, although a large quantity of metal used in munitions will have been recovered from the battlefields and utilized for other purposes. There will, however, always be a

PRICE FLUCTUATIONS OF TIN AND COPPER DURING 1914, 1915 AND 1916.

plentiful supply of copper, which will tend to depress the market. When the German and Belgian supplies of spelter become available and the Australian supply gets on the market, production in the United States will fall off consider-

the Allied Governments. This was additional to other large contracts placed earlier in the year. At the same time, large quantities of copper were required by the brass mills. The result was that by the end of the year the entire output

materially help to support the market.

During the year the market has been firm, with a steady rise in prices, and not much fluctuation. At the beginning of the year copper was about 23c, reaching to 27c by the middle of January. There

PRICE FLUCTUATIONS OF ANTIMONY AND SIELTER DURING 1914, 1915 ND 1916.

ably, and prices as a result decline. Lead will probably not suffer a serious decline, as it has not been affected by the war to the same extent as some other metals. There will be a marked depreciation in antimony, as the demand will be small after the war. That aluminum will decline to its former position is likely, as the war demand will have stopped.

#### Copper

Chief interest this year has centered in copper, this being the most important of all war ingot metals. As the war increased in intensity, with a prodigious expenditure of shells, the demand for copper became more insistent, culminating in contracts being placed in the United States for enormous tonnages by

of the United States' producers was taken up, and now there is no copper to be had for at least the first five months of 1917. With the market in such an oversold condition, the price naturally jumped up. It is estimated that the producing capacity of the States will soon be over one million tons per annum, which gives an idea of the enormous consumption of copper at the present time. The position of copper is now, of course, very strong, and is likely to be for some months to come. Opinions, however, differ as to what will happen to the market at the conclusion of the war, but it is probable that while prices will decline in sympathy with other metals, there will still be a big demand during the period of reconstruction, which will

was a gradual rise through February to 30½c, which was continued until the middle of May, when a new high price of 32c was registered. About this time the market weakened, and there was a steady decline to 29c in August. The market recovered and prices began to advance gradually through September and October up to the middle of November, when the market became very active and worked up to 38c by the end of that month. That price was maintained throughout December with a strong market. On an average the market was higher this year than in 1915.

#### Tin

Tin being a peace metal, has been adversely affected by the war, the con-

PRICE FLUCTUATIONS OF ALUMINUM AND LEAD DURING 1914, 1915 AND 1916.

sumption having fallen off, and prices being low when compared with other metals. The fluctuations that have taken place have been caused by the activities of submarines in destroying shipping. Tin being obtained from the Far East, ships carrying this metal are more likely to be interfered with than in the Atlantic, and on more than one occasion the fear of cargoes being lost has caused a sharp advance in price. This has been more in evidence on the New York market, as tin can only be imported into the United States on a permit obtained in London, and these permits have been generally difficult to obtain. Dealers have endeavored to carry large stocks of tin, but the increased consumption has sometimes depleted supplies of spot metal. It is generally believed that at the conclusion of the war there will be a considerable increase in the demand for tin and prices will advance. During the war there will not likely be much change in the situation. The position of this metal, however, is a strong one, as it is indispensable for many lines of manufacture and price has little effect on demand.

The market has been steady throughout the year except in the spring, when during April the highest point of the year was reached. It started at 45c and by the end of February jumped to 56c. Early in March the market declined to 50c, but soon recovered, and by the end of that month was 56c. Prices continued advancing until the highest level of 58c was reached about the second week in April. These advances were due to scares over submarine activities. The market soon began to react, and by the end of July the price had dropped to 44c, which was maintained until the end of September. Early in October the market became firmer, and the price advanced to 48c, which was held until the middle of December, when the market weakened slightly, and lost one point, finishing the year at 47c. Compared with 1915, prices have had a higher average, although the highest point of that year, 60c, was not reached, nor the lowest of 30c.

#### Spelter

This metal has been affected by the war, principally by reason of the fact that supplies from two big producing countries, Germany and Belgium, have been cut off. The pre-war situation has been considerably changed. When war started, America was called upon to supply the spelter requirements of the Allies and the demand was so great that the producers had to immediately increase their output. Eventually the production increased to such an extent that it became equal to the demand, and the situation became adjusted to meet the new conditions. The present output of spelter in the States is about 650,000 tons a

year. As spelter is used in making brass, this accounts for the big export business and domestic consumption. The big business has been done with the brass mills in high-grade spelter, the galvanizers having been operating at reduced capacity all the year owing to the high cost of all raw materials. The outlook is not very favorable for the spelter industry in the States after the war, as this metal will probably be affected more than any other. The British Government has agreed to take over the entire spelter production of Australia. During each year of the war, the Government will take 45,000 tons of spelter and 100,000 tons of concentrates, also for ten years after the war. There will be a big decrease in the production of spelter in the United States and prices will decline. Belgian and German supplies will be available and the situation the same as before the war.

During the year spelter has lost ground, opening at 20c and closing at 14c, with a highest point of 24½c in February. A slight rise in January to 21c was continued through February, reaching 24½c, after which the market weakened and the price dropped back during March to 21c, recovering to 22c. Prices fluctuated during April, and at the end of the month began to fall, touching 12½c, the lowest point of the year, at the end of July. Another recovery brought the price up to 14c, which was maintained during August, September and October, gaining slightly in November, but finishing weaker at 13½c. The market was steadier than in 1915, and did not touch either the highest or lowest levels of that year.

#### Lead

Lead, although a war metal, has not been affected in the same degree as spelter or copper. The position of this metal has, however, for the most part, been a strong one, and the demand has absorbed the supply. The market this year has been generally stronger than during 1915, and prices higher. There has been a heavy war demand, and also an increase in ordinary consumption. In the States there has been a steady increase in production in order to take care of the larger demand, both export and domestic. There will be a depreciation in the price of lead after the war, but the market will no doubt decline gradually.

Prices show a net gain for the year. The market started at 7c, the lowest point of the year, and advanced steadily to 12c in April. During this month the market weakened and prices declined until 8¼c was touched in the middle of August. The market then recovered, and the price advanced to 9c up to the end of November, when another advance brought the price up to 9½c, which was maintained during December.

#### Antimony

As antimony is used in making shrapnel bullets, it has become a fairly important metal during war time. English antimony has been off the market, but supplies have been coming from China and Japan. The production of antimony in the Far East has been more than doubled, and there will be a large excess of supplies after the war. Comparatively little antimony is used in peace times, so prices will likely be considerably lower after the war than at present.

Antimony started the year at 40c and finished at 18c. A sharp advance at the end of January brought the price up to 48c by the end of February. This level was maintained during March and part of April, when a decline set in, and the market fell off badly, touching the lowest point of the year, 16c during August. The market then rallied to 18c, and has been steady since, that price having been maintained. The fall in 1916 was more pronounced than the rise in 1916.

#### Aluminum

This metal has been more or less scarce all through the year owing to the big demand and restricted production. This trade, as in the case of spelter, has been reversed, the United States having been called upon to export large supplies, which has had the effect of boosting prices. After the war prices will drop when trade is readjusted. Aluminum is becoming a more important metal for commercial purposes, a circumstance that will necessarily increase consumption. The market throughout the year has been high and steady, the price ranging around 68c, with a slight decline in June to 64c.

### MACHINE TOOLS

THIS year has been one of great activity in the machine tool business, due almost entirely to the remarkable development in the munitions industry. In spite of the big business during the latter half of 1915, the demand for munition equipment has been heavier still this year. A large number of existing machine shops have been equipped for making shells, and new plants have also been built for this purpose. Large contracts for shells have been placed from time to time, and the number of plants engaged in this work has materially increased. There is no comparison between the output of shells now and what it was at the beginning of the year. This development in the munition industry has been reflected in the machine tool trade, and consequently the demand for shell-making equipment has been heavy.

#### Development Due to Munitions

In the early part of the year, the principal demand was for 18-pdr. shrapnel and 18-pdr. high explosive shell equip-

## WELLAND SHIP CANAL

By J. L. Weller.\*

**C**ONSTRUCTION operations on the Welland Ship Canal have progressed steadily during the present year. The increasing shortage of labor has, however, been seriously felt by the different contractors, with the result that some portions of the work have had to be curtailed and the available labor largely concentrated on prism excavation and concreting in the locks. The work under contract at present is the same as last year, namely, Sections No. 1, 2, 3 and 5.

### Section No. 1

The building of the harbor embankments, which will form the new Lake Ontario entrance to the canal, has been carried on continuously during the year, and approximately 5,500,000 cubic yards of the 8,000,000 cubic yards of material available for this purpose have been placed. The end of the west embankment has now reached the outer extremity of the harbor, and the east embankment is within a few hundred feet of the outer end. The balance of the material available will be used to widen out the embankments. Eighteen of the reinforced concrete cribs which will form the foundation for the outer entrance

guard gates and single leaf gate, outlet valve chambers, etc., has been completed to coping level. The remainder of the wall is up to the elevation of the mooring chamber, 29 ft. below coping. The east wall is not quite as far advanced, being practically at the elevation of the mooring chamber over its entire length.

The long reinforced concrete retaining wall on the west side, extending from the foot of Lock No. 1 to the shore line, is complete with the exception of a short section where the contractor's concrete mixing plant is located. No dry excavation has been carried on during the year on this section, as the only remaining material to be excavated is being reserved for back-filling behind the lock walls.

### Section No. 2

Work on this section has been almost entirely confined to the excavation of the canal prism and the construction of Lock No. 2. Prism excavation has been carried on by four steam shovels and three dragline excavators, the material being hauled to Lake Ontario and deposited in the harbor embankments. For a distance of 8,000 ft. above Lock No. 2, the canal is in fill, and the east bank is being built well around to the east side; in this way a large regulating pondage is being formed at the head of the lock. The

floor, and in the east wall the foundation is complete to mitre still level. Considerable concreting has been done in four monoliths above this level. A small amount of work has also been done in the construction of the lower west entrance wall to the lock.

Excavation on the north half of the section is complete to grade, but a large amount of material has still to be removed from the south half. Very little work has been done this year at the site of Lock No. 3, beyond the excavation of the lock pit, as the contractors have concentrated their efforts on the building of Lock No. 2. The embankments which will form the regulating pond at the head of this lock are well advanced toward completion. A good deal of work has been done on the construction of the concrete protection to banks at the water line along the canal reaches on this section.

### Section No. 3

Operations on this section have consisted almost entirely of earth and rock excavation, practically no concrete having been placed during the year. The pits for Locks 5 and 6 have been excavated to grade, and are now ready for concrete, with the exception of the cleaning up of the foundations. The earth overlying the rock on the site of Twin

DIAGRAMMATIC REPRESENTATION OF ROUTE OF NEW WELLAND SHIP CANAL.

piers, and docking in the inner harbor, have been placed in position. Dredging in the channel has been carried on by three large dipper dredges, the dredged material being dumped to help form the harbor embankments.

Very good progress has been made on the construction of Lock No. 1, which is located just inside the shore line. The lock walls will be 82 ft. in height. A portion of the west wall of Lock No. 1, which includes the stairway from the lower to the upper level, recesses for the

construction of the canal banks is being carried on by an outfit of grading machines, and the embankments to form this pondage are now rapidly nearing completion.

The upper entrance walls to Lock No. 2 are practically complete, and the side walls of the lock have been under construction during the past year. These walls are built in 60-ft. monoliths, and the different monoliths in both the east and west walls are in various stages of advancement. The average height of the west wall is now 46 ft. above the lock

Locks No. 4 has been removed, and approximately 40 ft. of rock remains to be excavated before grade of the locks is reached. About the same depth of rock has still to be removed in the reach between Twin Locks No. 6 and the head of Single Lock No. 7.

The good rock from the excavation has been sent to the large crushing plant at the north end of the section, and furnished as concrete aggregate to sections No. 1 and 2. The inferior rock has been utilized as filling on low land on the east side of the flight locks. A washing

\*Engineer in charge.

plant has been constructed in connection with the rock crusher, and all stone requiring it is thoroughly washed before being used for concrete.

The earth excavated from the north end of the section has been sent to Lake Ontario and deposited in the harbor embankments, while that from the south end has been taken to the site of the high dam at the head of the flight locks, and is rehandled into the dam by two excavating machines. This dam has now reached the required elevation over a considerable part of its length. The contractors have erected their concreting plant at the head of Twin Locks No. 6, and, if conditions are favorable, it is expected that good progress will be made on concreting in Locks 5 and 6 during 1917. A small amount of work was done in building the long upper entrance wall between the head of Lock No. 7 and the guard gates.

#### Section No. 5

This section consists of deepening and widening the present canal on the west side, between Allanburg and Port Robinson. Four dredges have been employed in deepening the channel, and a number of steam shovels excavating dry material along the west bank. The dry excavation has now been completed. The dredged material is dumped in a basin cut in the canal bank and pumped by a 20-in. hydraulic dredge into pondages formed on the west side of the canal.

#### Bridges

The concrete substructures for several bridges over the canal have been completed, but contracts for the bridge superstructures have not yet been awarded.

#### General Data

The distance from Lake Erie to Lake Ontario by way of the Welland Ship Canal is 25 miles.

Lake Erie is 326 ft. higher than Lake Ontario, and this difference in level will be overcome by seven lift locks, each lock raising or lowering a vessel a distance of 46½ ft.

The present canal has 25 lift locks of only 12 to 14 ft. lift.

The dimensions of the locks of the Welland Ship Canal will be:

800 ft. long in the clear, 80 ft. wide, and 30 ft. depth of water.

The locks on the present canal are:—270 ft. long, 45 ft. wide, and 14 ft. depth of water.

Locks Nos. 1, 2, 3 and 7 will be single locks, while Locks Nos. 4, 5 and 6, ascending the escarpment at Thorold, will be double locks in flight—that is, each pair rising one above the other.

The dimensions of the canal between locks and on the long level between Thorold and Lake Erie, will be: 200 ft. wide at the bottom, 310 ft. wide at the water line, and 25 ft. depth of water.

The largest vessel sailing the lakes today is 625 ft. long, with 59 ft. beam, and as navigation of the channels connecting the Upper Lakes does not at present permit of a greater draught than 20 ft., it is considered that the capacity of the Welland Ship Canal, when completed, will be ample for a great many years to come.

When greater depth is required, it can be obtained by dredging out the canal to 30 ft. in depth, as the locks and other structures are now being built to afford that depth of water.

Total quantity of earth to be excavated:—40,000,000 cubic yards; of rock, 6,000,000 cubic yards.

If all this material were loaded on dump cars, of the kind which may be seen passing along the construction railway parallel with the canal, it would require a train of such cars 15,000 miles long, extending half-way around the globe, to hold it.

Total quantity of concrete to be placed:—2,200,000 cubic yards.

This amount of concrete would build a solid wall 20 ft. high, 6 ft. wide, and 100 miles long.

The lock gates will be of the single-leaf type, extending clear across the chamber, instead of double gates meeting at the centre, as on the present canal. The lower gates will be 82 ft. high, 88 ft. long and 10 ft. thick, built of structural steel, and weighing 1,150 tons. The upper gates, which will rest on top of the "breast wall," will be 37 ft. high, 88 ft. long, and 10 ft. thick.

The time required to pass a vessel through one of the Ship Canal locks will be about 20 minutes. The actual raising or lowering of the vessel in the lock will require but eight minutes.

The estimated time of passing a loaded freight vessel through the entire canal, from lake to lake, is eight hours, as against 15 to 18 hours on the present canal.

When traffic is heavy, or becomes congested for any reason, several vessels of present canal size can be passed through the Ship Canal locks at one lockage.

The estimated cost of the canal is \$50,000,000.

#### Location Features

The Welland Ship Canal is being built on a new location from Lake Ontario to Allanburg, a distance of 12 miles; and from Allanburg to Lake Erie the course of the present canal is, more or less, followed. Whereas all the previous canals have had their Lake Ontario entrance at Port Dalhousie, the entrance to the Ship Canal is located at Port Weller, three miles east of Port Dalhousie, where a new harbor of most commodious proportions is being constructed.

From Lake Ontario, the canal follows the course of the Ten-mile Creek, crossing the present canal twice, until Allanburg is reached. Here the present canal

is entered, and utilized as far as Port Robinson, a distance of about three miles, this stretch being known as the "Deep Cut." At Port Robinson the canal enters the Welland River, which will be raised 6 ft. to canal level, by means of a dam and regulating weir at Port Robinson. This raising of the river will flood about 1,600 acres of low land between Port Robinson and the head of the river, west of Wellandport. From Port Robinson, the canal will follow the Welland River to the Town of Welland. At Welland, the present canal is again entered, and followed through to Port Colborne, on Lake Erie, with the exception of about 1½ miles, at a point known as Ramey's Bend, just this side of Port Colborne, where a very pronounced (S) curve occurs in the existing canal. Here the Ship Canal takes a straight course through a heavy rock cutting, resulting in some saving in distance and contributing toward greater ease of navigation.

#### Lake Erie Entrance

It is proposed to maintain the long level between Thorold and Port Colborne at elevation 568, which is extreme low water level in Lake Erie; consequently, vessels, except during periods of extreme low water, will have to lock up from the long level a few feet into Lake Erie at the Guard Lock, which is to be built in the rock cutting at Ramey's Bend, just north of the Village of Humberstone.

The present Lake Erie entrance at Port Colborne will be utilized for the Ship Canal. The harbor will not require to be deepened at present, as it already has a depth of 22 ft.; but the present breakwater will be extended about 2,000 ft. out into the lake in order to deaden the swells which now cause some disturbance, at times, to vessels lying at the elevator docks. Where the Ship Canal follows the course of the present canal, the latter will be deepened and widened on the west side, to the enlarged dimensions.

The Welland Ship Canal construction railway, which commences at the shore line of Lake Ontario, and extends along the west side of the canal to the rock crushing plant, north of the Town of Thorold, a distance of nearly 8 miles, and which is double-tracked throughout its length, and equipped with 60-lb. rails, complete interlocking and block signal system, and telephone train despatching system, was built and is maintained by the Department of Railways and Canals for the use of the contractors in hauling excavated material from Sections Nos. 1, 2 and 3 to the harbor embankments in Lake Ontario, and for hauling stone, excavated from the site of the flight of locks at Thorold to the site of Locks Nos. 1, 2 and 3. The railway is well ballasted with stone and kept in such condition that no accidents of any consequence have occurred since it has been in operation.

There will be 22 bridges crossing the canal to carry existing highways and railways, as well as several bridges over pondages, one swing bridge carrying the construction railway over the present canal, and a temporary bridge for the Grand Trunk Railway over the foot of Twin Locks No. 4. A few of these will be swing bridges, where the conditions favor this type, but the majority will be ascule lift bridges, or bridges of what are commonly known as the "Jack-knife" type.

For construction purposes, the canal route has been divided into nine sections. Section 1 being at the Lake Ontario end, and the others following consecutively through to Lake Erie. Of these nine sections, four are under contract at the present time, namely, Sections Nos. 1, 2, 4 and 5. Sections 1, 2 and 3 include all the locks, and the value of the work which they represent is practically equal to one-half of the estimated cost of the entire canal.

Lock No. 1 is situated at the Lake Ontario entrance just inside the shore line; Lock No. 2 one and one-half miles south; Lock No. 3 two and one-half miles south of Lock 2, and at the points where the Ship Canal will cross the present canal. Locks Nos. 4, 5 and 6 are double locks rising immediately one above the other, and these, with single Lock No. 7, a little further on, will raise and lower vessels 186 ft. over the escarpment at this point.

## OUR PACIFIC COAST SHIPPING AND SHIPBUILDING

by A. H. Seaton

THE shipping industry of British Columbia is really just emerging from its infancy, and is only now on the threshold of what bids fair to be an era of great prosperity. The reasons for this are not difficult to find, being chiefly due to the newness of the country and the undevelopment of its resources, which, although almost unlimited, have so far hardly been touched; as a consequence, while there has always been a strong demand for import tonnage, no return cargoes have been available. Our Pacific Coast cities have not been able to offer inducements to shipowners that were worth considering when compared with those offered by those more fully developed on the adjacent coast of Washington. Although a thriving Trans-Pacific trade has been done for many years, we in British Columbia have only recently begun to seriously take a hand in it. An earnest effort is now being made to put the cities of this Province definitely on the map as shipping centres, Vancouver is by far the largest of these, with Victoria second. There are now represented in Vancouver three

companies engaged in Trans-Pacific trade—The Canadian Pacific Steamship Lines, The Dollar Co., and The Canadian Australasian Royal Mail Line. In addition, there are several companies engaged in the coasting trade, the latter fast assuming considerable proportions. Chief among them are the C.P.R., the G.T.P., the Union Steamship Co., and The Terminal Navigation Co.

### Wallace Shipyards

A few months ago an order was placed with the Wallace Ship Yards of North Vancouver for three large, five-masted schooners by the Canada West Coast Navigation Co., the intention be-

SCHOONER E. R. WEST ON B.C. MARINE CO. WAYS, VANCOUVER.

ing to place them in the lumber carrying trade. The principal dimensions of these vessels are as follow:—

Length over all, 250 ft.  
Length on L. W. L. about 235 ft.  
Beam outside of planking 44 ft.  
Maximum draught 16 ft.  
Total displacement 3,500 tons.  
Tonnage for cargo 2,500.  
Cost equipped \$250,000.00.

The auxiliary propelling machinery will consist of 2-Bolinder, Semi-Deisel-engines of 160 h.p. each.

The Wallace Shipyards have also, with a commendable spirit of enterprise, undertaken the building of a fourth schooner of the above dimensions, with the intention of either operating or selling her, as opportunity may offer. This company has also an order of two steel twin-screw cargo vessels of 4,200 tons displacement, one for British interests, and one for Matsui & Co. of Japan. Their chief dimensions are:—  
Extreme length over all, 315 ft.

Length between perpendiculars 300 ft.  
Beam 45 ft.  
Maximum draught 18 ft. 6 ins.  
Depth of hold 27 ft.  
I.H.P. of engines 1500.

Tonnage for cargo 4500, including coal carried in bunkers.

The Wallace Shipyards are also well equipped for handling ship repairs, having two marine railways, one of them being capable of docking vessels up to 2,500 tons' displacement. The other and smaller one is intended chiefly for vessels such as tugs and scows; it is nevertheless capable of docking vessels up to 1,000 tons displacement.

Situated in the City of Vancouver itself there are two other concerns engaged in the business of shipbuilding and ship repair—The B. C. Marine, Ltd., and The Vancouver Ship Yard. The first named has accommodation for docking vessels up to 2,000 tons displacement. It is quite a promising little plant, well equipped for all ordinary ship repairs, and being close to the new Government grain elevator and dock, is very favorably situated. While this company in past years have built quite a number of fairly large vessels, they have not so far taken the share in the present revival of the ship-building industry to which they seem to be entitled, but have confined themselves strictly to repair work.

The Vancouver Shipyard has a well equipped little plant for small craft, and has a marine railway which is capable of hauling out vessels up to about 600 tons deadweight.

### Vancouver Drydocks, Ltd.

Arrangements have been made by Charles Meek for the erection of a plant which marks the beginning of a new era as regards Vancouver shipping. It will operate under the name of The Vancouver Drydocks, Ltd., and is calculated to fill a long felt want, all large vessels hitherto having been forced to go elsewhere when actual dry-docking was required, many hundreds of thousands of dollars thus being lost to Vancouver annually. The present intention is to build one double section floating drydock which will be capable of handling vessels up to 18,000 tons displacement, this being sufficient to accommodate the largest vessels on this Coast at present with ease. It is confidently expected that this dock will be in actual operation within the next twelve months. It is also their intention to operate an extensive ship-building plant.

The White Pass & Yukon Railway Co., have also completed arrangements for the building in Vancouver of two small passenger vessels, one for service between Cariboo and Taku, and one on

**Atlin-Lake.** That for the river service will be a typical stern-wheel craft, 165 feet long by 35 feet, however, with accommodation for eighty passengers. The other will be a twin-screw craft propelled by internal combustion engines, of 90 feet in length by 18 feet beam, and with accommodation for 100 passengers. She is intended for day-light service only. These two vessels will be shipped North in sections, and assembled there.

#### Genoa Shipbuilding Co.

An order was recently placed with the Genoa Shipbuilding Co., of Victoria for three wooden schooners, similar in all respects to those now building in Vancouver. Two of these are now nearing completion, and should be able to go to sea early in the coming year. The only two companies in Victoria who combine ship-building with repairs are the Victoria Machinery Depot and Yarrow, Ltd., the latter firm having just completed a light draft steel vessel for the Indian Government. They are now erecting the frame-work of a second one. Both these firms are equipped with marine railways capable of docking vessels of 3,000 tons displacement.

The shipping of Victoria Harbor is chiefly composed of small coasting vessels engaged in log towing for the numerous saw mills. It is also the headquarters for the Pacific Whaling Co., who operate quite a numerous fleet. Victoria is also a port of call for almost all the larger vessels which berth at Vancouver.

A great amount of work has been done by the Dominion Government to improve the docking and berthing facilities of Victoria, an extensive system of piers being now under construction at the mouth of the harbour. These are sheltered by a magnificent breakwater which is now almost completed. The work was rendered necessary owing to the depth of water in the harbour proper being only sufficient for vessels of about 18 feet draught at all stages of the tide. The minimum depth of water alongside the piers under the shelter of the breakwater is now 35 feet, which is sufficient for the largest vessels at present plying to the Pacific Coast.

#### COLLINGWOOD SHIPBUILDING CO.

NEW and repair work carried out during 1916, and meantime in progress at the Collingwood Shipbuilding Co. plant, Collingwood, Ont., in addition to munitions production, includes the following:—

##### Vessels Built and Completed

S. S. Royalite, S. S. Iocolite, S. S. Sarnolite, each 250 ft. x 43 ft. x 18 ft., 800 I.H.P., and of 2060 British Board

of Trade gross tonnage for the Imperial Oil Co.

##### Repair Work Completed

S. S. Mariska, S. S. Sarnian, S. S. SSarnian, S. S. Inland, S. S. Hamonic, S. S. Iroquois, Tug Onaping, S. S. Mariska, S. S. Malton, S. S. Thos. J. Drummond, S. S. Glenlivet, S. S. C.G.S. Bayfield, S. S. Iroquois, Tug D. S. Pratt, S. S. Fordonian, S. S. J. Frater Taylor, Tug C. W. Chamberlain, S. S. Kearsage, S. S. Honoreva, lighter Harrison, S. S. Caribou, tug Maitland, S. S. Collingwood.

##### New Work On Hand

Ship No. 48—For Montreal Transportation Co., 550 ft. x 58 ft. x 31 ft., Board of Trade gross tonnage 8000 tons, 2400 I.H.P.

Ship No. 49—250 ft. x 43 ft. 6 ins. x 25 ft., about 2500 gross tons, oil tanker for the Imperial Oil Co.

Ship No. 50—Similar to No. 49.

Ship No. 51—Cargo boat 251 ft. x 43 ft. x 20 ft., 1200 I.H.P., Board of Trade gross tonnage 2500, for Owners' Account.

##### Repair Work on Hand

S.S. J. A. McKee, S.S. Alberta, S.S. Glenlyon, S.S. Iroquois, S.S. Imperial.

#### YEAR OF PROSPERITY IN ST. JOHN, N.B.

THE year 1916 has been one of the busiest in the history of St. John. The export trade of the port has broken all records and has placed it in the second place of all Canadian ports in this respect. The export values for the fiscal year ended March 31, 1916, amounted to \$120,042,590, as against \$43,872,932 in 1915 and \$21,359,760 in 1914. Imports for 1916 amounted to \$11,165,463; for 1915, \$9,112,916; and for 1914, \$9,433,220. For the six months from April 1 to September 30, the values of exports at St. John were \$55,970,441. Halifax followed with exports of \$19,538,644.

During 1915, the lumber shipments to the United Kingdom and the continent of Europe were as follows:—Spruce deals, 139,486,183 sup. ft.; hardwood plank, 4,333,709 sup. ft.; birch timber, 1,611 tons. The figures in 1914 were respectively 84,027,826 sup. ft. (spruce deals); 7,651,181 sup. ft. (hardwood plank); and 1,411 tons (birch timber). The lumber exports to the United States in 1915 amounted to \$1,371,450.45. During the first three quarters of 1916, they were valued at \$1,076,126.44, as against \$994,279.30 in the corresponding period of 1915. Grain exports in 1915-16 were 14,186,522 bushels, valued at \$11,405,186, compared with 8,612,703 bushels, valued at \$8,738,780 the previous year. The customs receipts for 1915-16 were

\$2,706,891.57, as against \$1,670,957.65 the previous fiscal year. During the twelve months ended March 31, 1916, 3,118 vessels, of 1,790,948 registered tons, entered the port, as against 3,178 ships of 1,587,493 tons in 1915.

The bank clearings at St. John for 1916 are a fair indication of the city's business progress. For the eleven months to December 1, they totalled \$82,218,682, as against \$70,365,188, for the eleven months of 1915. The first week in December exceeded the record of any previous year, with a total of \$2,500,355, compared with \$1,777,511, in the corresponding period last year. Building figures for 1916 to December 1, aggregate \$462,350, as against \$323,400 for the like period in 1915.

The postal transactions at St. John for 1916 have not yet been given to the public. For 1915, the total revenue was \$148,316.51, as compared with \$144,333.68 in 1914. Money orders issued in 1915 amounted to \$401,873.69; in 1914 to \$399,924.18. Money orders paid in 1915, \$944,882.28; in 1914, \$906,017.24.

The winter port season opened very auspiciously this year, six transport vessels from C.P.R. liners and 1 barkentine being loaded in November. At present, the piers are very busy, with the prospect of a much busier season ahead. It is hoped that another new pier, No. 16, will be ready early in the New Year. The Government elevator, which was destroyed in August, 1914, is being rebuilt on another site farther down the harbor, immediately south of the custom house. It will have an initial capacity of 550,000 bushels. The plant will not be ready for use this winter.

##### Industrial Development.

Speaking industrially, two large plants have been added to the city's industries during 1916. The most important of these is the McAvity machine shop, 80 x 400 ft., which was erected in six weeks and is now turning out munitions. The other industry is that of the manufacture of hydrated lime, which has been begun on a large scale by Messrs. Gandy & Allison.

On the whole, St. John has prospered in 1916. It tried out "Daylight Saving" during the past summer, and found it a success during the months of May, June, July and August. The Board of Trade is moving to have the plan made either Dominion-wide or Maritime Province-wide. That body has also entered upon a campaign to secure a fuller utilization of the port for British-Canadian traffic, its slogan being "Canadian Ports and Canadian Railways for Canadian Business." The suggestion we understand is meeting with much acceptance both in Canada and Great Britain.

**GRAIN EXPORT FROM MONTREAL**  
GRAIN received in the elevators of the Montreal Harbor Commission and the Grand Trunk Railway elevators up to the end of November 30, piled up the very respectable total of 71,646,455

sioners' elevators alone during the current season to the end of November were 47,658,804 bushels, and as two-thirds of this amount came in by rail, December will probably add some more to the total. In 1915, for the same time, the total re-

38 and 39; drill No. 4, belonging to C. S. Boone Dredging Co., and four scows also belonging to the same firm. The steel dredges Fundy and Delver, and the tug Alice, belonging to the Dominion Dredging Co.; tug Meteor, of Port Colborne

OCEAN TERMINALS AT HALIFAX, N.S. AS THEY WILL APPEAR WHEN COMPLETED.

bushels. Of this amount the Harbor Commissioners' elevators, according to a statement prepared for the Commission by Lieut.-Colonel F. Massey, provided 46,391,926 bushels, and the G. T. R. elevators the remaining 25,254,529 bushels. From the harbor elevators alone this is an increase over last year of 11,197,-

ceipts were only 34,862,861 bushels, so that there is this year an increase of 11,197,454 bushels.

#### MUIR BROS. DRY DOCK CO.

AROUND the Muir Dry Dock at Port Dalhousie are laid up the following:—Steamers Garden City, Jas. H. Shrigley,

Tug Co., and the large scow No. 38, belonging to the Great Lakes Dredging Co., were among the late dockages made. The Dry Dock has had a busy season repairing wooden boats for the most part, although several steel ships were also docked, and we hear that this establishment, so long associated with the repair-

OCEAN TERMINALS AT HALIFAX, N.S. AS THEY WILL APPEAR WHEN COMPLETED.

454 bushels, and the Grand Trunk total export also greatly exceeds that of last year.

The receipts in the Harbor Commis-

Natironeo; tugs Meteor, Eleanor, Crawford, Lynn B; dredges Chas. Boone and The Meade; concrete scow Pioneer; and Great Lakes Dredging Co. scows Nos.

ing of wooden boats, is to shortly branch out into metal work, which will be an added convenience for lake shippers generally.

## WESTERN DRYDOCK & SHIPBUILDING CO.

DURING the past year the Western Dry Dock & Shipbuilding Co., Port Arthur, Ont., completed two full canal size ocean going freighters, 261 ft. x 43 ft. 6 in. x 28 ft. 2 in., having triple expansion engines, with cylinders 20, 33 and 54 in. in diameter, by 40 in. stroke, supplied with steam by two Scotch boilers operating under natural draught, each 14 ft. 6 in. in diameter by 11 ft. long, of 190 pounds per sq. in. working pressure.

The machinery was placed amidships. Four cargo hatches were provided to each vessel, two forward and two aft.—26 ft. by 18 ft. Deck and other equipment consisted of six 4-ton American Hoist & Derrick Co. winches; 8 in. by 8 in. American Shipbuilding Co. windlass and steam steering gear; 7½ k.w. Engberg electric lighting outfit; steel masts, cargo derricks, etc. In the case of both ships, Thorgerd and Blaamya, delivery was made five months from date of laying the keels. Six more of the same type of vessel are under contract for delivery in 1917.

At the present time the capacity of the plant is being doubled, this involving an additional building berth and additions to slips. The concrete drydock in connection with the plant—700 ft. x 100 ft. x 16 ft.—was utilized during the year to carry out extensive repairs on some 35 vessels, and, in addition, to facilitate the carrying out of minor repairs on many others. The various departments of the plant are modernly equipped, individually electrically driven tools being prominent features. At present, 800 men are on the payroll, but early in 1917, it is expected, that 1,200 men will find steady employment. The departmental constituent of the plant embraces shipyard, machine shop, blacksmith shop, boiler shop, pattern shop, iron foundry, pipe, electric, and joiner shops.

## NOVA SCOTIA STEEL & COAL CO.

AT New Glasgow, N.S., the Nova Scotia Steel & Coal Co. have one steel cargo steamer of 220 ft. B.P., 35 ft. beam, and 20 ft. moulded depth, under construction. This boat should be completed some time in the early spring, 1917. She will be fitted with two Scotch marine boilers, 11 ft. 6 ins. in diameter and 11 ft. 6 ins. long, of a working pressure of 185 pounds per sq. inch., and De Laval steam turbines developing about 1,000 h.p. geared to the propeller by means of two reduction gears, reducing the speed of the turbines from 4,000 to 80 revolutions at the propeller. This is the first De Laval turbine to be installed in any steamship for propelling purposes, and the first of any kind in Canada. The boat will be fitted with large hatches and complete cargo discharging gear

There are also two ships in the early stages of construction, each of 248 ft. 9 ins. B.P., 35 ft. beam, and of 20 ft. moulded depth. These two boats will be fitted with triple expansion engines and two Scotch boilers. Their completion is expected in the latter part of 1917.

## SHIPPING SEASON AT PORT McNICOLL

DURING the season of 1916 there arrived at Port McNicol, 226 grain-laden vessels, while 106 trips have been made by the C.P.R. steamers with passengers and package freight. The elevator has handled nearly 44,000,000 bushels of grain, about twice as much as any other part, and there have been handled through the sheds 28,243 tons of flour and feed, eastbound; and 69,100 tons of package freight westbound.

The following vessels are lying in the harbor with cargoes aboard: J. F. Taylor, 185,500 bushels of wheat; G. A. Graham, 147,000 bushels wheat; W. G. Morden, 735,250 bushels wheat; Valcartier, 297,760 bushels corn; Haggerty 519,500 bushels wheat; Masaba, 87,000 bushels wheat; Sarnian, 188,000 bushels wheat; Mariska, 142,980 bushels wheat; E. B. Osler, 332,950 bushels wheat; Emperor, 545,026 bushels wheat; Philbin, 350,000 bushels wheat; Davidson, 342,000 bushels wheat; Sultana, 135,000 bushels wheat; Adams, 305,700 bushels oats; Congdon, 372,000 bushels oats; Garretson, 368,000 bushels oats. Total, 5,230,616 bushels afloat.

## SHIPPING SEASON AT HEAD OF LAKES

A COMPARATIVE statement issued by the Board of Grain Commissioners of Canada giving the total quantities of grain shipped from Port Arthur and Fort William during the seasons of navigation 1913, 1914, 1915 and 1916, shows that during the past year a record has been created both in number of cargoes shipped from the head of the lakes and in the quantity of grain carried. In 195 Canadian vessels, and 565 American vessels, 253,969,500 bushels of all kinds of grain were carried east. This is an increase of 341 cargoes and 52,200,000 bushels over 1915, and is more than double the amount shipped in 1914. In 1914 American vessels carried only one-third of the amount of grain shipped from the head of the lakes, but in 1916 Canadian vessels carried only 13,000,000 bushels more than American vessels.

In the season just ended, 656 United States vessels carried 84,397,000 bushels as against 138 vessels carrying 23,000,000 bushels in 1914. For the period September 1 to December 13, 1916, 65,680,000 bushels were shipped to Canadian

and United States ports, in 474 vessels, of which amount 39,500,000 bushels went to United States ports and 26,180,000 bushels to Canadian ports.

## THOR IRON WORKS, LTD.

AT the Thor Iron Works, Toronto, a full canal-size ocean-going freighter, 261 ft. long, x 43 ft. 6 ins. beam, x 28 ft. 2 ins. deep, is at present under construction for delivery on May 1, 1917. A similar vessel is on order for delivery in September, 1917. During the present year, in addition to general steel plate work contracts completed and in progress, a considerable number of marine repair jobs—large and small—were successfully negotiated.

## CANADIAN VICKERS, LTD.

THE bulk of the work carried out during 1916 at the plant of Canadian Vickers, Ltd., Montreal, was for naval and military requirements, the specific details of which for obvious reasons are here withheld. The ice-breaker J. D. Hazen, originally contracted for by the Dominion Department of Marine and Fisheries, and later transferred to other owners, was launched in May and completed in November. A steel twin screw centre ladder hopper and barge loading dredge, also for the Dominion Department of Marine and Fisheries, was launched on November 18, her leading dimensions being as follows:—Length between perpendiculars, 284 ft.; breadth moulded, 48 ft.; depth moulded, 20 ft. 6 ins.; mean draught, 16 ft. 6 ins.; dredging depth in specified condition, 57 ft. Contracts on hand include the construction of two 7,000 tons deadweight cargo steamers for neutral owners, with delivery in 1917. The floating dry dock Duke of Connaught was largely taken advantage of during the season of navigation, no less than 36 ships having been docked and repaired, including considerable repair and other work on transports. A number of repairs were also carried out to vessels afloat in Montreal harbor.

## POLSON IRON WORKS

NO new vessel construction featured the activities of the Polson Iron Works, Toronto, until the last quarter of 1916, when work was started on the building of two ocean going freighters for Norwegian owners. The leading dimensions are as follows:—Length over all, 261 ft., between perpendiculars, 251 ft.; beam moulded, 43 ft. 6 ins.; depth moulded, 22 ft. 11½ ins.; deadweight 3,500 tons. The usual repair and outfitting of lake craft was carried out during the season of navigation; however, munitions manufacture constituted the major part of the plant production.

## ORGANIZATION

*Organization—The adaptation of means and methods to the needs and conditions as they exist.*

THE High Powered Motor Truck, a development of Modern Transportation methods, to meet the requirements of modern business. The Canadian Tump Line, an adaptation of a primitive method, to meet the pressing needs of a critical situation.

Such is the basic principle on which our Service Department has built up an organization second to none. Our experts have proven themselves able to meet the emergencies which arise during the inception of new industries and to adapt the means and methods at hand to suit the requirements or to evolve new processes where the old have proven inadequate. We are in touch with all the problems that arise in a variety of different manufacturing processes and have helped to solve them. The wide experience thus gained is at your disposal, to save you from costly experiments and to point the path to increased production and profits.

Our connection with leading up-to-date manufacturers, as illustrated in the following pages, places us in a position to serve you promptly and to good advantage.

We look forward to a New Year of New Industries and New Methods. We have the organization—Let us serve you.

*If it's Machinery—write "Williams"*

**The A. R. Williams Machinery  
Co. of Vancouver, Limited**

495 Railway Street  
Vancouver, B. C.

**A** VIGOROUS offshoot of the parent organization with well equipped Service Department and experts in the special manufacturing needs of the Great West. We are specialists in Shipbuilding, Contracting and Heavy Engineering Plants.

Large stocks of Woodworking and Ironworking Tools as well as Mill and Engine Room Supplies carried in our Warehouses at Vancouver, B.C., enable us to offer you attractive prices on goods which if purchased in Eastern Markets would have to bear the burden of excessive freight rates.

The large and up-to-date stocks of all kinds of Machinery in our Eastern Warehouse at Toronto together with the very extensive stocks carried at Vancouver, enable us to offer immediate delivery on almost any requirement.

Write us direct to Vancouver. We can serve and save you money.

## *Greenfield* Usefulness

A careful study of the various attachments and of the grinder itself; then adapting these to the various requirements you will find use for in your plant. In its range of work lies its value. But if it had not Greenfield quality behind it, its life and usefulness would be short-lived.

Its rigid, accurate and convenient construction, its attachments for cylindrical, internal and flat grinding as well as for all sorts of tool making and sharpening, make it indispensable.

Write for our catalogue explaining various uses, etc.

## A Record-making Metal Cutting Machine

**SPEED ACCURACY ECONOMY  
STABILITY**

AN IDEAL MACHINE FOR SHELL  
STOCK UP TO 12 by 12 inches. Either  
belt or motor driven.

**Holds the world's record for the most accurate cut-  
ting at the least price.**

Being positive of our claims we are  
willing to send your selection of  
machine on approval.

**Our Offer is to YOU.**

*Write us if you desire further particulars*

ALSO, WE GUARANTEE TO  
KEEP EVERY MACHINE WE  
SELL SUPPLIED WITH THE  
FAMOUS RACINE H-S TUNG-  
STEN BLADES.

1. The most rapid machine of its kind on the market to-day.
2. Guaranteed as to accuracy and you can absolutely depend on it to give you a perfectly true cut.
3. The most economical in operation of any machine of its kind, and will soon pay for itself in blade saving alone. Its simple operation does not require high-priced labor, and one man can operate as many as ten machines.
4. Very simple construction. No complex parts to get out of order. No delays because of delicate mechanism breaking.

## Pipe Cutting Machine

Regard to detail, close attention to construction, coupled with a knowledge of the requirements of pipe-cutting machine has enabled us to produce the best machine of its kind on the market.

Strength is very noticeable and ensures a superior grade of work in the shortest possible time. The protected gearing is a good safety factor.

Each machine will cut 10 consecutive sizes which range from  $\frac{1}{4}$ " to 18".

A machine of this capacity and quality should be of great value to you.

*Inquire at once.*

## “AMERICAN” ALL STEEL SPLIT PULLEYS

Better than cast iron because of much less belt slip.

Better than wood—they hold a belt as well and wear better and are not a fire risk.

“American” steel pulleys, made by the *American Pulley Company*, are better than other steel pulleys, because they are stronger, better made, and use less power because of less windage.

Stock sizes—3" to 72" diameter.  
Larger diameters to specifications.  
Special pulleys for unusual duty.  
Interchangeable Bushings.

First in Volume of Sales.  
First in Efficiency.  
First in Esteem of Users.  
First All-Steel Belt Pulley Made.

## LeBLOND PROJECTILE LATHES

### OUR HEAVY DUTY UNIVERSAL TURRET LATHES ARE PARTICULARLY WELL SUITED FOR PROJECTILE WORK

The **BROAD, HEAVY CARRIAGE BRIDGE** with the square lock thrust bearing, in addition to the regular dovetail, enables the turret to sustain exceptionally heavy cuts. This construction is clearly shown in the detail below.

The index mechanism is accurate to .001 of an inch, and the turret can be connected to the taper attachment for taper or form boring. Multiple cross-stops and an automatic longitudinal stop assure a duplication of sizes without measuring. Taps are given a positive lead by simply engaging the lead screw.

Our **PATENT DOUBLE FRICTION BACK GEARED HEADSTOCK** provides ample power for the heaviest cuts, besides enabling the speed changes for roughing and finishing to be made while running and under cut.

The **QUICK-CHANGE GEAR** provides an unlimited range of threads and feeds for all classes of work. Our patent compensating Heavy Duty Bed Section provides three times the carriage bearing surface found on other lathes of the same size, and additional strength in the same proportion.

Sizes: 17" to 36" swing.

## The difficulties of threading noses in 4.5 Mark VII

shells due to the recess, is easily overcome by the use of thread milling machines.

## Holden-Morgan THREAD MILLERS

give a full thread with much smaller width of recess than is possible with taps.

Cut below illustrates the Holden-Morgan Thread Miller for Shrapnel and High Explosive Shells up to 6 in. diameter.

The shell is inserted at the left-hand end of machine, and is forced by a Quick-acting Clamp to centralize between two surfaces within the work mandrel, thus securing perfect concentricity of the threads.

One operator can manipulate two machines.

Machine is equipped with Oil Pan, Pump and necessary Piping, and one suitable Thread Milling Hob.

No countershaft is furnished, as all machines may be driven from a jack-shaft.

## The BEAUDRY HAMMER

Gelt or motor-driven. Send for  
Catalog.

### BEAUDRY & COMPANY

INCORPORATED  
8 Oliver Street  
BOSTON, MASS., U.S.A.

—for “Nosing-in” and  
Banding Shells

Illustration shows Beaudry Hammers “nosing-in” high explosive shells. In this operation, starting with easy blows, so as not to make the metal flow unevenly to any point; the hammer delivers increasingly heavy blows until the shell is nosed. Beaudry Hammers are also ideal for banding high explosive shells, especially where strip copper instead of a ring is used for the band.

**Beaudry Hammers Save Fuel, Time and Labor—cut forging costs.**

Shell work well illustrates their adaptability to all kinds of general forging work.

## MUNITION MACHINERY LIST

ALL machines listed are practically new and can be inspected at the plant of the Union Switch and Signal Co., Swissvale, Pa., or the plant of the Westinghouse Air Brake Co., Wilmerding, Pa. Our office at Swissvale will take care of all inquiries and arrange for inspection at Wilmerding, Pa.

These machines used in the manufacture of 18-pdr. British Shrapnel Shells. For detailed description see List No. 2.

- 1—Double Spindle Vertical Center Punching Machine.
- 1—Double Spindle Vertical Centering Device.
- 39—Reed Prentice Semi-Automatic Lathes.
- 60—Potter & Johnston 6-A Automatics.
- 2—Notching Machines (Special).
- 4—12 x 24 Modern Grinders.
- 3—12 x 36 Modern Grinders.
- 1—10 x 50 Norton Grinders.
- 2—Base End Grinders.
- 2—No. 14 Besly Grinders and Press for glueing emery paper to Discs.
- 2—Brown & Boggs Marking Machines.
- 3—West Hydraulic Tire Presses for Inserting Copper Band (with pumps).
- 4—No. 4 Warner & Swasey Turret Lathes.
- 2—Allis Chalmers Special Purpose Machines for finishing copper bands.
- 1—Tapping Machine for retapping fuse socket.
- 1—Sprague Canning Co's Soldering Machine.

- 6—2-spindle Vertical Paint Machines.
- 3—Horizontal Spindle Paint Machines.

### DISCS.

- 1—Ransom Disc Grinder 12" Disc.
- 1—Gorton Disc Grinder 12" Disc.
- 3—Baker Bros. 2-spindle 1" x 6" Semi-Automatic Drill Presses.
- 2—No. 2 Garvin Automatic Tapping Machines.
- 1—Machine Double Ended for filing radius.

### FUSE SOCKETS.

- 6—No. 24 New Britain 4-spindle Automatic Machines.
- 2—2-Spindle High Speed Avey Drill Presses.
- 2—Single Spindle Avey Drill Presses.

### COPPER BANDS.

- 6—Taylor & Wilson 4" Pipe Cutting Off Machines.  
Three of these used to cut-off open end of shells about three months.
- 1—Disc Machine for cutting-off Copper Bands.

Miscellaneous machinery used for the manufacture of 18-pdr. Shrapnel and Cartridge Cases.

### LATHES.

- 1—20" x 8' Reed Lathe.
- 1—20" x 6' Reed Lathe.
- 1—20" x 10' Bullard Lathe.
- 7—14" Extra Heavy Reed Hand Operated Turret Lathes.

### GRINDERS.

- 1—Diamond Machine Co.'s No. 2 Tool Grinder.
- 1—American Twist Drill Co.'s Drill Grinder.
- 1—Tool Grinder 12" x 10" Grinding Wheel.
- 1—Bridgeport Safety Emery Wheel Co. Tool Grinder.
- 1—No. 3 Bridgeport Safety Emery Wheel Co. Tool Grinder.
- 1—No. 11 $\frac{1}{2}$  Cincinnati Universal Tool Grinder.

### DRILL PRESSES.

- 1—3-Spindle Geo. Burnham Co. Drill Press.
- 3—16" Canedy Otto Drill Presses.
- 1—16" Prentice Co. Drill Press.
- 1—20" Prentice Co. Drill Press.
- 1—20" Cincinnati Drill Press.
- 1—Belt Driven Buffing Machine.
- 3—Motor Driven Double Ended Buffing Machines.
- 2—Curtis Centrifugal Oil Separators.
- 2—Gross Oil Filters.
- 3—Bowser Motor Driven Oil Pumps.
- 1—Small Brown & Sharpe Milling Machine.
- 1—Hand Milling Machine.
- 2—No. Bristol Hand Millers, New.

## Complete Bullet Plant—Labor Required, 4 Men

These presses, etc., used in the manufacture of bullets for the 18-pdr. British Shrapnel.

- 3—3-ton Quigley Lead Pots (one new) with cast iron parts for three furnaces.
- 3—Water-jacketed Slug Molds with stands.
- 1—Slug Mold Car for narrow gauge track.
- 2—Slug Heating Furnaces.
- 2—J. Robertson & Son Triplex Hydraulic Pumps with valves and fittings to connect with Extrusion Presses.
- 2—J. Robertson & Son 650-ton Hydraulic Extrusion Presses.
- 2—Automatic Reel Winding Racks. (Six reel capacity.) (Structural steel.)
- 2—Reel Racks (24 reel capacity) structural steel.
- 72—Reels.
- 12—2 ton capacity bullet dump buckets.
- 2—No. 75 1/2 Bliss Power Presses.
- 6—Bliss Tumbling Barrels.

## Miscellaneous Machinery

(For detailed description see List No. 2, pages 18 and 19).

- 1—Beaman & Smith Horizontal Boring Mill.
- 7—Seven-Spindle Beaman & Smith Milling Machines.
- 1—1 1/2 Ton Link Belt Cage Operated Mono-Rail Electric Hoist.
- 1—2,000 lbs. Bement-Miles Double Frame Steam Hammer.
- 1—William Sellers & Co., No. 377 Horizontal Boring Mill.
- 20—3X Reed Prentice Semi-Automatic Lathes.
- 21—Libby Turret Lathes.
- 19—Lees Bradner Thread Millers.
- 15—Putnam Engine Lathes.
- 7—Thurlof Waving Machines.
- 4—3A Warner & Swasey Hollow Hex Turret Lathes.
- 3—Wave Nicking Machines.
- 2—No. 2 West Tire Setters and Pumps.
- 3—Holden Morgan Mechanical Wrenches.
- 9—15" American Geared Head Lathes with turrets.
- 4—Jenckes Copper Band Turning Machines.
- 1—Shell Washing Machine.
- 2—No. 4 Warner & Swasey Screw Machine.
- 3—Automatic Copper Band Cutting-off Machines.
- 1—Chain Feed Box Printing Press.
- 3—No. 4 Warner & Swasey Screw Machines.
- 18—6A Model, Potter & Johnson Automatics.
- 3—D-8 Colborne Heavy Duty Drills.
- 1—4 1/2" H.E. Shell Nosing Press Pump and Accumulator Piping and Valve.
- 2—2X Reed Prentice Lathes.
- 4—Steinle 24" Turret Lathes.
- 6—No. 11 Amalgamated Lathes.
- 4—18" Reed Shed Waving Machines.
- 1—No. 1 West Tire Setter Press and Pump.
- 1—De Vilbiss Varnish Machine.
- 1—Holden Morgan Plug Milling Machine.
- 1—Morgan No. 9 Box Nailing Machine.
- 17—14" Reed Heavy Turret Lathes.
- 10—2 3/4" Cleveland Model C Automatics.
- 2—National Air Compressor, 1 Reservoir.
- 5—1X Reed Prentice Semi-Automatic Lathes.
- 3—65-gallon Bowser Pumps.
- 6—24" Davis Boring and Chucking Lathes.
- 6—20" Hindman High Duty Lathes.
- 1—Fischer Universal Profile Tool Grinder.
- 1—Newton Vertical Type Continuous Miller.
- 2—25" x 40" Wickes Engine Lathes, one with taper attachment, one without.
- 2—26" x 10" Pittsburg Engine Lathe.
- 1—Brown-Boggs Shell Marker.
- 6—Van Dorn Aerial Grinders.

## HYDRAULIC MACHINERY

### Hydraulic Presses, Pumps and Valves A Design for Every High Pressure Purpose

Whatever "Your Pressing Needs" may be Press, Pump, Valve, Accumulator or Intensifier—we have a design which will suit your requirements. If your conditions are peculiar and our standard line does not include the correct type of machine we will furnish a new design to fit your wants. Just a few of the hydraulic machines we build are listed below:

#### Hydraulic Accumulators, Pumps, Valves and Fittings.

Hand, Belt, Motor and Steam Driven Pumps, Accumulators and Intensifiers. Every Type of Hydraulic Valve and Fitting for High Pressure Service.

#### Hydraulic Presses.

Aluminum Wheel Presses, Arbor Presses, Asbestos Shrink Presses, Automobile Wheel Rim Presses, Baling Presses, Binding Presses, Brake Shoe Filling Presses, Broaching Presses, Broom Making Presses, Cherry Presses, Chocolate Presses, Cotton Baling Presses, Cork Pin Presses, Cork Chip Presses, The Presses, Drawing Presses, Elongating Presses, Emery Wheel Presses, Fibre Board Presses, Forging Presses, Flanging Presses, Forging Presses, Forming Presses, General Purpose Presses, Horn Comb Presses, Hot and Cold Plate Presses, Leather Presses, Leather Belt (double) Presses, Paper Calendar Roll Presses, Paper Collar Presses, Portable Presses, Packer Presses, Pulley Grinding Presses, Rubber Presses, Seed Oil Presses, Shell Binding Presses, Shell Forging Presses, Shell Rolling Presses, Straightening Presses, Tire Presses, Tapping Presses, Valcanizing Presses, Wood Presses, Wheel Presses

## "BURKE" No. 1 MILLING MACHINE

A machine tool built for small jobs. An efficient little worker and a big time and money saver on all classes of lighter work.

#### SPECIFICATIONS:

Longitudinal feed of table	6 inches
Transverse feed	3 1/4 inches
Vertical motion to knee	5 3/4 inches
Maximum distance between center of spindle and table	7 inches
Working surface of table	3 1/2 x 12
Greatest distance between centers (6-inch swing)	23 1/2 inches
Largest diameter of cone	6 inches
Smallest diameter of cone	3 1/4 inches
Driving Belt	2 inches
Taper hole in spindle	R. and S. No. 9
Hole in spindle	1/2 inch
Height over all	21 inches
Loose pulley on countershaft	7 x 2 1/4
Speed of countershaft	280 revolutions
Weight complete	190 pounds
Weight packed	260 pounds

## WRIGHT HIGH SPEED HOIST

For use wherever loads must be frequently raised or where it is essential to raise them quickly.

In their construction, the use of STEEL and malleable iron has reduced to naught those lost minutes and cents due to break-downs and wear-outs.

The very high efficiency of these HOISTS places them in the class of the truly efficient labor-saving devices in plant production.

The WRIGHT Non-fouling Chain Guide assures you that the chain will NEVER foul nor clog in operation, whether used in vertical or horizontal position.

A feature of regular construction assures the foundry man of a positive lack of vibration and that the small hanging parts of sand on the cope will not BREAK off in lowering to close the flask.

With such a combination of material and construction, we feel that the praises of WRIGHT SERVICE are well earned.

18-INCH GEARED HEAD LATHE.

NO. 3 UNIVERSAL MILLING MACHINE.

## HENDEY

**Hendey Lathes** are built with the requirements of exceptional service in mind—everything in design and construction is co-ordinated to this end.

36 DIFFERENT THREADS AND FEEDS are had through mounted Change Gearing; each change being quickly made through controlling handles in Gear Boxes.

It will be worth while to look into the possibilities of Hendey Lathes for your shop and tool room purposes.

**Hendey Millers** have a wide range of spindle speeds and feeds and will give you production of a remarkable degree of accuracy and perfection. They are free from the usual complicated features. All working positions are secured with but few and easily understood movements on the part of the operator.

HENDEY MILLERS WILL TAKE ANY KIND OF A MILLER JOB THAT COMES INTO THE MODERN SHOP.

## Bridgeford-

All Bridgeford Lathes are made for exceptionally heavy duty — are liberally dimensioned—making for freedom from repairs. Heavy, but not clumsy in operation—no complicated mechanism. This means successful operation by inexperienced help.

The qualities that have made for Bridgeford reputation in prominent steel mills and railroad shops should appeal to the work now in hand.

The 26" lathe (upper cut) is being used in large numbers by leading makers of shells for finishing operations on shells as large as 12". The 27" plain turning machine (lower cut) for roughing operations on shells—8" to 12".

Quick deliveries in return for early inquiries.

## 28" Conradson Engine Lathe

*For Band Turning  
Duplex Helical Drive*

The reason for that massive strength in the headstock is because it is cast integral with the bed. Two bronze worm wheels are mounted on the spindle and are driven by hardened worm, having ball thrust bearings. The worms are driven by a train of heat-treated Nickel Chrome Steel gears. The gear system runs in oil.

The spindle thrust is taken by a massive ball thrust bearing immersed in oil. Imported ball thrust bearings are used. The spindle bearings of Phosphor Bronze are of the conical sleeve type. By this description you will get an idea of the construction. The speed and quality of work produced are above the ordinary. Inquire at once.

**MACHINE TOOLS**

(Continued from page 730.)

ment, which were the types of shell being made in quantity at that time. As a number of plants had been equipped during 1915, business was not as active as later on in the year. However, early in March orders for 4.5 in. and 6-in. shells came along, and a new class of machine tools was required, which stimulated business. About the same time the manufacture of 18-pdr. high explosive shells was discontinued, the plants being then turned over to the larger calibre shells. The situation continued to develop until June, when the contracts for 8-in. and 9.2-in. shells were placed. This again called for still heavier equipment. The industry now became extremely active, as not only was further equipment for shrapnel shells required, but for the larger shells as well. Business continued good right along until early in December, when the demand fell off and the market became quieter. During November there was a call for fuse-making equipment. There has been all through the year a steady demand for tool-makers' equipment, but it has been most difficult to obtain. The so-called ordinary business has been quiet, and no large orders have been booked.

**New Tools**

An interesting feature has been the development of new special purpose tools for munitions, which might also include standard machines adapted for making shells. The single purpose lathe, which had been developed in the States in the previous year, was introduced into this market in connection with the bigger shells. Some Canadian makers designed and built single purpose lathes and other tools, widening the field of activity among domestic machine tool builders. Various types of machines for different operations in shell manufacture have been placed on the market by both Canadian and U. S. concerns, all of which have contributed to bring up the munitions output to its present quantity basis. There has been quite a demand for large swing lathes for the larger shells. The development in shrapnel shell equipment has not been so noticeable, this having reached more or less finality in 1915. Canadian machine tool builders have enjoyed a most prosperous year, and were never in better shape financially. They have had all the business they could handle, and have shown much ingenuity in the new tools which have been put on the market.

**Deliveries and Prices**

Machine tool builders in the United States have extended their connections in Canada and have found it a profitable field. During the year, especially the first half, many of these concerns were

doing a big business, both European and domestic. Their output was for months sold well ahead and consequently deliveries have been very backward on most types of machine tools, shell and tool making equipment particularly. This has many times been a source of great inconvenience as machinery was badly wanted owing to the urgency of the shell production requirements. Latterly, conditions in this respect have improved, as the demand in the States is not nearly so heavy as at one time, European business also has declined considerably. Machine tools have of course advanced in price during the year, due principally to increase in cost of raw materials and higher wages. Standard lathes, for instance, are now about 60 per cent. higher than they were before the war, while heavier equipment such as cranes have advanced almost 110 per cent. Prices on the general run of machine tools are from about 30 to 40 per cent. higher.

The second hand machinery business has been less active as the market had already been well combed last year. Later on in the year, however, the supply of this class of equipment was greatly increased through a number of munition plants in the States finishing their contracts and offering their equipment for sale. In many cases a ready market was found.

**Future Outlook**

With regard to the coming year, indications point to a satisfactory volume of business, but perhaps not as heavy as during 1916. The majority of our munition plants are well equipped, but extensions to existing establishments are still being made, while two or three quite large plants are under construction. Renewals will also be required as present machinery gets worn out. The situation however is somewhat unsettled on account of the German peace proposals, which, although turned down, will no doubt be renewed later in the year. The effect of these proposals on the munitions business will be nil, that is until they have reached the stage where negotiations have assumed a more definite status and peace is within sight.

**HIGH-SPEED TOOL STEEL**

THERE has fortunately been less excitement in the high speed tool steel market this year than during 1915. While the demand has been greater on account of the increased consumption by munitions plants, available supplies have increased and there is now little fear of a shortage. During the year there has been a gratifying increase in the production of Canadian-made high-speed tool steel, which has come at a time when it was most needed. Shipments from Great Britain have been

comparatively small this year owing to the extremely heavy demand for tool steel in the Old Country which has left very little for export except to France and Russia. As the steel plants in Great Britain are all controlled, no tool steel could be exported or even manufactured for export without a permit from the Minister of Munitions. The fact that production in England has been largely increased has not relieved the situation in Canada to any marked degree, as the output has been absorbed in the home market.

Supplies of tool steel have been coming through from the United States rather more freely, the demand there not being quite so urgent, while the output of course has been largely increased. At the beginning of the year the situation was very tight. Consumers in their anxiety to cover for their requirements, fearing a famine, ordered heavily which tended to force prices up and caused much excitement. The shortage threatened serious consequence at one time, but fortunately no plants were ever held up on this account. Production has been increasing all the time, and this together with careful use in the various plants allowed the crisis to pass.

Owing to the high cost of high speed tool steel, greater vigilance has been exercised in its use and in the disposal of scrap. Tool holders are being used to a greater extent, so that small pieces of tool steel can be used and a saving be thereby effected. Although the situation is easier than during the early part of the year, the price has not declined to any appreciable extent, prices ranging from \$2.75 to \$3 a pound for standard qualities. Some special alloys which have been put on the market are giving satisfactory results on munitions but they are higher priced.

The output of tungsten has been increased, but all supplies have been quickly absorbed by the tool steel makers. The manufacture of tungsten powder in England has developed in a satisfactory manner, but the entire output is monopolised there. Production of tungsten in Burmah and the United States has also increased, but these supplies have also been readily absorbed.

Indications point to an easier situation during 1917, also a probable decline in prices, depending of course largely on developments in Europe. The heavy consumption of tool steel this year has been entirely on account of munitions, and the large contracts for shells which have been placed, and those pending in addition, will ensure a continued steady demand. The future is somewhat obscured as the return of peace conditions would certainly be followed by a large falling off in demand.

This list subject to trade discount for quantity

equipment but the market is still active. It is anticipated that added stimulus will be given as it is understood, that should peace negotiations be delayed, the production of munitions will require to be increased in order to live up to previous contracts. This will mean additional machinery in many shops now working on the various shells.

#### Scrap

With the uncertainty that prevails in all industrial circles regarding the immediate future, the scrap situation like all others is in an unsettled state. Quotations are comparatively firm, but with a declining tendency. With the exception of brass turnings and scrap zinc, both of which have declined  $\frac{1}{4}c$ , prices here are unchanged but unsteady.

**Toronto, Ont., Dec. 26.**—The year just closing has been one of great prosperity, but not one of much development, except in industries associated with the manufacture of munitions. The trade of the country, principally in exports, has increased greatly in volume, and the balance is now very favorable. The returns each month have shown increases, as have also the Customs receipts. While this large volume of trade is due principally to the war, and is, therefore, of a temporary nature, the benefit will be felt in future years through the accumulation of wealth which will assist in development. Further developments in connection with the peace proposals have not had any material effect on the business situation.

#### Steel

The market is quiet on account of the holiday season rather than because of the peace proposals, which have not as yet had any material effect on the situation. In spite of the peace talk, prices have held firm, but no advances have been announced during the week. The prospects of peace, although they appear somewhat remote at present, may check the upward movement in prices for a time, depending, of course, upon political happenings in Europe. Some steel products, such as plates, tubes, and black sheets, will likely go higher; in fact, an advance in black sheets is expected early in January. There is no improvement in the sheet situation. Sheet bars continue scarce, and are high in price, while transportation difficulties are hampering the mills. Plates will likely remain at a high level for a considerable time, as the demand for ship material is heavy, and will continue to be so more or less indefinitely owing to the urgent demand for tonnage. The shortage of coke and coal is the principal cause of anxiety in the steel trade at present. The trouble is due principally to transportation difficulties, originating in a shortage of cars and engines; in addition, the bad weather has made the

situation more difficult for the railways to handle.

The iron and steel markets in the United States are on the whole decidedly quiet, due partly to the peace proposals and also on account of the holiday season, the market being usually quiet at this time of the year. There is no sign of weakness in prices, and none is expected in the meantime. The transportation situation appears to be growing worse, and, if there is no improvement in the near future, it will result in the mills curtailing production. There are no price changes of particular importance to note this week.

#### Pig Iron

Prices on domestic pig irons are still withdrawn, and no information is available as to when new quotations will be issued. Stocks of foundry iron have been exhausted, and Canadian furnaces have no pig iron of this grade to sell. The market is quiet, with the situation unchanged. In the United States the pig iron market is also quiet, with prices unchanged.

### CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion \$100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the Commission headquarters are at Ottawa.

#### Machine Tools and Supplies

There has been comparatively little actual business done this week, although a few inquiries have been received by local machinery houses. The quietness is due entirely to the holidays and not to peace talk, which has had little or no effect on the situation. Local supply houses were very busy early in the week, but were quieter later. Prices continue very firm, with a possibility of further advances next month.

#### Metals

Locally, the market has been unsettled, and prices on some metals have declined. This is due to weakness in New York rather than any inherent weakness in the situation here. The German peace proposals upset the New York market, but had less effect in London. Business has been quieter, due to the holidays, and a return to former activity is not expected until after the New Year opens.

**Copper.**—The peace proposals have unsettled the market, and it will no

doubt remain in this condition until the outlook becomes better defined. The extreme high price of copper made it susceptible to a situation such as has arisen, and it may have a permanent effect on prices. Copper has declined 2c locally, and is now nominally quoted at 36c per pound.

**Tin.**—The market is easier owing to the general unsettled situation, but the position of this metal has not weakened appreciably. The market is weaker locally, and prices have declined 2c, the current quotation now being 45 $\frac{1}{2}c$  per pound.

**Spelter.**—The peace talk has made the spelter market very unsettled, and prices have declined 2c, making the current quotation 13c per pound.

**Lead.**—The metal is holding its own, although the market is dull and inactive. Local price unchanged at 9 $\frac{1}{2}c$  per pound.

**Antimony.**—The market is dull and easy, with quotations unchanged at 18c per pound.

**Aluminum.**—No change in the situation in this market. Local price, 68c per pound.

### TRADE OF NEWFOUNDLAND

THE trade of Newfoundland during the past year has been good. The only exception is the lumber industry. A good market exists for pit props in Great Britain, but the scarcity of tonnage has prevented shipments, and a large stock will be carried this winter in consequence. Prices at present are falling. The Bell Island Iron Mines have been working most of the year at full capacity and with profitable prices prevailing for the products.

It is too early to get reliable information regarding the year's catch of codfish, but expectations are that it will about equal that of last year, and bring greater returns because of the high prices now prevailing. Out of total exports of \$18,960,000 during the colony's last fiscal year, codfish represented \$10,394,000. Lobster exports show improvement. The seal catch this spring yielded \$637,000, as against \$94,000 in 1915. The latter, however, was one of the worst seasons ever experienced in the history of Newfoundland.

Manufacturers on the whole have had a good year, and, in the wholesale and retail trade, demands have been good and payments satisfactory. The revenue of the Government during the current year has exceeded expectations, and on the whole the colony is looked upon as being very prosperous at the present time. It is interesting to note that Newfoundland, in company with other borrowing countries, has for the first time in its history floated a public loan in New York and on terms favorable to the borrower.

## Simonds Slitting Saws for Metal

We are manufacturing Slitters in practically any quantity in sizes from 11½" up to 10' in diameter, either Carbon Steel or High Speed Steel. When ordering, specify kind of steel wanted and send blueprint or give carefully full specifications. We also manufacture a complete line of—

Cold Saws for Cutting Off Metal.  
 Inserted Tooth Metal Cutting Saws.  
 Files.

Hack Saw Blades.  
 Flat Ground Stock for Gauges.  
 Screw Slotting Metal Saws.

## Engineering

**Sarnia, Ont.**—The Sarnia Metal Products Co., plans an addition to its plant.

**London, Ont.**—An addition will be made to the plant of the Ford Motor Co., to cost \$25,000. Plans are being prepared.

**Toronto, Ont.**—W. H. Banfield & Sons Co. will build an addition to their plant to cost \$10,000. A building permit has been issued.

**Hull, Que.**—The Hull Steel Foundries, Ltd., propose making improvements to their plant, including a blast furnace.

**Pembroke, Ont.**—The Pembroke Machinery Co., contemplate building a machine shop. Complete equipment will be required.

**Brantford, Ont.**—Kerr & Goodwin will build an addition to their factory. P. H. Secord & Sons of this town are the contractors.

**Sarnia, Ont.**—The H. Mueller Mfg. Co., will erect and equip buildings to manufacture brass.

**Ingersoll, Ont.**—Fire on Dec. 19 destroyed the blacksmith shop at the Noxon Works, doing considerable damage, which is only partly covered by insurance.

**Kingston, Ont.**—J. J. Harty, vice-president of the Canadian Locomotive Co., who is in London at the present time, has secured an order from the War Office for forty consolidated locomotives.

**Port Arthur, Ont.**—J. J. Carriek, of this city was the successful tenderer for the Pic River pulp and timber limits, comprising 1400 square miles of timber. A pulp mill costing \$1,000,000, to have a daily output of 150 tons, will be erected.

**Belleville, Ont.**—The guaranteeing of bonds to the amount of \$250,000 priced low assessment, low water rates and sewer extensions are the terms upon which the Miller Co. of Akron, Ohio, will establish in Belleville their Canadian rubber factory, it is stated.

**Victoria, B.C.**—The Aetna Iron and Steel Co., has been organized here with a capital of \$250,000 to manufacture bars and small structural shapes. As soon as possible the smelting of ores will be taken up to supply the requirements of the plant. David Milne of Medicine Hat, Alta., is the president.

**Kingston, Ont.**—The Lazier Paper Mills Ltd., has been taken over by a syndicate who will make considerable improvements to the plant and materially increase production. The plant has been used for the manufacture of straw paper for corrugating and carpet linings, and will be enlarged for the manufacture of box boards, wrapping papers, waterproof specialties, etc.

**Donnacona, Que.**—A new paper machine is to be added to the equipment of the Donnacona Paper Co., whose mill is located at Donnacona, Que. The company now has two machines in operation and the new one will make a third. It will be a 160-inch machine and will double the output of the plant. Six new grinders are also being added to the ground wood mill, which will raise the capacity from 75 to 100 tons of ground wood per day. The Donnacona Paper

Co., was organized in 1912 and has made good progress since its incorporation.

**Quebec, Que.**—The Dominion Iron & Wrecking Co., have secured the plant of the Standard Steel Foundries at Outremont, Que., and that of the Consolidated Brass Foundries at Pointe au Tremble. It is the intention to consolidate these plants and engage in the manufacture of munitions. New equipment is to be installed, including 15 electric furnaces of the newest type at the Consolidated Brass plant.

**Belleville, Ont.**—The Hought Paper Mills have taken over a paper mill at Camden East near here to manufacture paper specialties. The directors are equipping their plant to manufacture water leaf for parchmentizing, being the only mill in Canada to manufacture pure vegetable parchment. They will also make light-weight bleached papers for waxing purposes and high-grade light-weight specialties. They expect to be ready to make paper not later than February 15.

## Saving or Wasting?

The manner in which you handle the drinking water problem in your plant may seem to be a small matter to you—but investigate. The results will be surprising.

The old-time faucet is costly. Running hour after hour, day after day, its ceaseless flow is costing you money, yet without any better service.

## Puro Saves 35%

A Puro Sanitary Drinking Fountain will cut that water bill 35%. We can prove that it has done that for others.

It will give every employee a safe, saner draught of bubbling water free from the contamination of the common drinking cup.

In a word, it is the only sanitary Drinking Fountain that is really safe, sanitary, simple, automatic in control, and easy to attach.

## THE COST OF SELLING

SCARCELY necessary, is it? to protest that you must spend some money, much or little, to keep yourself and your merchandise known to your customers and should-be customers.

This you admit, but—DO YOU FOLLOW CLOSE UP THE LEAD OF YOUR CON-VICTION?

Are you spending the money?

Let's look at the cost of close-up work in

## The FARMER'S MAGAZINE

A half-page 12 times will cost you \$367.20 (\$30.60 per insertion). A full page, \$714.00 (\$59.60 per insertion).

Not a heavy annual cost to canvass the choicest class of farmers in this country—farm homes of greatest prosperity, progressiveness and capacity.

But—are you keeping a salesman always on the job?

You should—and can, at so low a price.

Write in about it.

### An Ideal Locker for Clothes and Personal Tools

This combination Tool and Clothes Locker will be very useful to the mechanic because it provides ample space for clothes and a safe place for his tools.

**Canadian Machinery**  
*Classified Advertising Section*

**Revelstoke, B.C.**—The Trout Lake Shingle Mill Co., mill was destroyed by fire recently.

**Smith's Falls, Ont.**—The Canadian Cooperage Mfg. Co., will commence work at once on the erection of a factory to cost \$20,000 to replace the one recently damaged by fire. F. F. Kessel, manager, is in the market for new machinery.

## Trade Gossip

**The Foundry Products Ltd.**, of Calgary, which has recently been incorporated, is an off-shoot of the Canadian Western Foundry and Supply Co. W. A. McLaws is president of the new company, and Geo. A. MacKenzie is general manager.

**Galt, Ont.**—The local Hydro Commission, which has for some time been faced with the problem of building a new substation or enlarging the present building, has finally decided to add another storey to the present building on Dickson street.

**Newfoundland Trade.**—Increases of more than four million dollars in imports and nearly six millions in exports are shown in a statement of the foreign business of the colony of Newfoundland for the fiscal year ended on June 30 last. Total imports were \$16,427,336 and exports \$18,969,493.

**Russia Orders Engines.**—It is announced in Montreal that the number of locomotives now being built by the Canadian Locomotive Co., Kingston, Ont., for the Russian Government is 80, an order recently placed having been for 50. Russia has ordered a total of 380 locomotives in the last month, of which the Canadian Locomotive Co. is building 130.

**Potassium Chlorate from Japan.**—As a result of the war, there has been a rapid development of the manufacture of potassium chlorate in Japan. An oversupply of the product has now affected the market. There are about thirty-three factories, and the total output is placed at 7,000 barrels a month, which will be increased to 10,000 barrels when projected extensions are completed.

**Calgary, Alta.**—Machine and wood-working shops are being equipped at the School of Technology and Art for the training of returned veterans in mechanical pursuits. The contract for almost the entire equipment is being executed by the Canadian Western Foundry & Supply Co., Calgary, through their machinery and tool department, of which J. E. Middleditch is in charge. T. A. McAuley is general manager of the company.

**The Imperial Munitions Board**, in a circular letter to munitions manufacturers, wishes to know if they have all the machinery needed in their factories, or if the Board can assist them in getting the machinery or supplies. It is stated that a central inspection office will be established in Toronto in the near future, where manufacturers can send their samples. In this way the inspection staff may be reduced twenty-five per cent.

**Canada's November Trade.**—Huge increases in Canadian trade are indicated for the month of November and the eight months of the fiscal year. November trade was \$186,066,351 as against \$154,225,481 in corresponding month last year. For the eight months total trade was \$1,499,255,942, against \$863,670,349. November imports increased \$27,000,000 to \$72,690,790. In the eight months imports increased by nearly \$250,000,000 to \$557,235,197.

Domestic exports for November totalled \$109,558,950, an increase of \$17,000,000. For the eight months these exports increased by our \$300,000,000 to \$731,592,639.

**New Cut Gear Plant at Winnipeg.**—The growing demand for cut gears in the West is responsible for the formation of a new concern which has been registered under the name of the Winnipeg Gear & Engineering Co. They will engage in the manufacture of cut gears of all descriptions, including sprocket, worm, and bevel gearing, specializing on the production of rawhide pinions. E. H. Derby is manager, and F. Ponton is superintendent, the offices and plant being located at 197-199 Princess street, Winnipeg, Man.

**Montreal Port Season.**—The export grain trade from the port of Montreal for the season for all kinds totalled 71,589,046 bushels, a gain of 28,000,000 bushels for the year. Twenty-one million bushels left port under sealed orders. The wheat exported was 34,668,656 bushels, corn 5,201,056 bushels, oats 26,616,786 bushels, barley 4,000,120 bushels, rye 685,406 bushels, peas 23,022 bushels. Earle & Thompson head the list of exporters with over 14,000,000 bushels, with James Carruthers & Co. coming third with 10,963,090 bushels. It was the biggest year in the history of the port of Montreal.

**Mills for Publishers.**—Building their own paper mills is the only solution apparent to the many owners of small newspapers in the U. S., who attended the hearings before the Federal Trade Commission at Washington, D.C., into the high cost of paper. Several companies are being formed by the publishers to build mills. Ohio publishers plan to secure a mill in Canada where pulp is

plentiful, and several of the larger newspaper publishers will take stock in this company. Paper manufacturers charged with restricting the output of newsprint, say, that there is more profit in wrapping and wallpaper.

**Power Production and Export.**—During the past fiscal year there was produced in Canada for domestic consumption and for export purposes 2,250,747,989 k.w. hours of electrical energy. Of this amount 1,228,966,730 k.w. hours were used in Canada and the remainder sent abroad. The greatest power producing plants in Canada are those of the Canadian Niagara Power Co., which produces 411,700,000 hours, the Cedar Rapids Power Co., 414,784,000 k.w. hours, the Ontario Power Co. producing 815,969,000, and the Electrical Development Co. producing 429,998,500 k.w. hours. The Canadian Niagara Power Co. exported 400,521,090 k.w. hours, the Electrical Development Co. 34,652,000 k.w. hours, the Ontario Power Co. 199,135,160 k.w. hours and the Cedar Rapids Power Co. 358,763,000 k.w. hours.

**Toronto, Ont.**—The Hydro-Electric Commission has given to the town of Sudbury, Ont., an estimate that it will cost \$2,900,000 to develop power on the French River, and this power delivered in Sudbury will cost between \$26 and \$28 per h.p. The estimate was asked for in order that the town would have something definite upon which to base its negotiations with the British-American Corporation which has agreed to establish an industry employing 3,000 people by opening up the Murray Mine three miles west of Sudbury and erecting smelters and possibly a refinery involving an outlay of over five million dollars. The representatives of the company met the town council of Sudbury last week. The council is favorable to passing a by-law for Hydro development at French River, providing the company agrees to assume a share of the financial obligation to the Hydro Commissions, which the securing of this power will entail to the town.

**Domestic Demands for Steel.**—It has been evident for some time that the demand for steel for domestic purposes would gradually expand even in the face of high prices and munitions necessities. In the United States and Canada maintenance cannot be postponed indefinitely and even new construction is being pressed. Structural steel work is now quite active in the United States, especially for railroad bridges and cars, and structural material for shipbuilding as well as factory construction. The heavy demand for steel for domestic use is, of course, caused largely by the fact that buyers have realized that foreign demand

**W. H. BANFIELD & SONS**

372 Pape Avenue, Toronto, Can.

is apt to persist for some time to come, and that it is doubtful whether maintenance and new construction can be postponed until peace and lower price for steel obtains. In fact, a good deal of new work will have to be done at top prices, thus increasing the overhead for future years. Peace talk had some effect on orders and on prices for a day or two, thus indicating what the effect of peace would be, but in the latter part of this week the old tendency to advances returned.

**Personal**

Gordon Perry has been elected a director of the National Iron Works, Toronto.

A. B. Calder has been appointed assistant general passenger agent of the C.P.R., with offices at Montreal.

W. W. Butler has been appointed vice-president and general managing director, and F. A. Skelton vice-president and sec-treasurer of the Canadian Car & Foundry Co., Montreal.

Philip J. Duff, who for over two years has been resident engineer for the John verMehr Eng. Co., on the construction of the new filtration plant, Toronto, has resigned his position to accept an appointment on the inspection staff of the Imperial Munitions Board, Ottawa.

William Phillips has been appointed by the Canada Steamship Line as their Canadian representative in the office of the Robert Reford Co., Montreal, general agents for Canada. Mr. Phillips was born in Toronto Jan. 31, 1870, and has had an extensive experience in railway and steamship business.

B. H. Phillips has been appointed secretary-treasurer of the Montreal Machinery & Supplies, Ltd., recently organized for the supply of contractors' machinery and plant for munitions manufacturers. The office is at McGill Building, Montreal. Mr. Phillips was formerly connected with the Montreal Ammunition Co., and the National Bridge Co.

W. F. Angus, vice-president and managing director of the Canadian Steel Foundries, Montreal, will shortly retire from his present position to take executive office with the Dominion Bridge Co. Mr. Angus was connected with the Dominion Bridge Co., in 1896 when he joined the staff of that company as engineer and draughtsman. He also served for a time with the Laurie Engine Co. He afterwards joined the Canada Switch & Spring Co., which was formed into the Montreal Steel Works, and his advancement with this company was a rapid one until 1911, when, on the formation of the Canadian vice-presi-

dent and managing director, a position which he has held since that time. The Canadian Steel Foundries is of the Canadian Car & Foundry group, and the directors of the latter have, we understand requested Mr. Angus to remain on the board of both companies.

**Tenders**

**Thorold, Ont.**—Tenders will be received by the undersigned until December 30, for the supply of a turbine pump and electric motor. Specifications can be secured from the undersigned, L. S. O'Connor, Superintendent of Waterworks, Thorold, Ont.

**Montreal, Que.**—Tenders will be received until Jan. 2 for construction of C.N.R. terminal site in Montreal, including excavation, both earth and rock, and disposal of same, reprofiling of slopes, concrete retaining walls, etc. Plans and specifications, form of bid and agreement, can be seen at 411 Dorchester street west, Montreal.

**Toronto Ont.**—Tenders will be received, addressed to the chairman, Board of Control, City Hall, Toronto, up to January 16, for the installation of a 40 million Imperial gallon centrifugal sewage pump at the main sewage pumping station, Toronto. Specifications and forms of tender may be obtained at the Works Department, Room 6, City Hall.

**Ottawa, Ont.**—Tenders will be received up to January 15, for the construction of a reinforced concrete lighthouse tower and fog alarm building combined, and a wooden dwelling, at Point Abino, township of Bertie, Welland county, in the Province of Ontario. Plans, specifications, form of contract and schedule of wages, can be seen, and forms of tender procured, at the Department of Marine, Ottawa; at the Harbor Master's office, Toronto, and at the post offices, Welland, Port Colborne, St. Catharines, Bridgeburg, Hamilton and Brantford.

**Building Notes**

**Saskatoon, Sask.**—The Saskatoon Public School Board have disposed of a school site near the Quaker Oats Mill to the Winnipeg Oil Co. for the sum of \$2,500.

**Toronto, Ont.**—The City Architect has issued a permit for the construction of the new Union Station. The permit is for the main building and east wing on Front Street, between Bay and York Streets, which is estimated to cost \$2,800,000. The main building will cost \$2,000,000, and the east wing \$800,000. The total cost of the building will be \$3,400,000.

## Refrigeration

**Niagara Falls, Ont.**—The Pure Ice & Cold Storage Co., has let contract for erection of a 10-ton ice making plant to be ready for operation by March 1, 1917.

**Lindsay, Ont.**—Plans for rebuilding the cold storage plant of Flavelles, Ltd., are being prepared by the Madison Cooper Co., New York City. It will cost \$75,000.

**Winnipeg, Man.**—The Ontario & Manitoba Cold Storage Co., it is reported, will build a cold storage warehouse to cost about \$100,000 in the near future.

**East Bella Bella, B.C.**—The Gosse-Millerd Packing Co., has had installed a 7-ton ammonia compressor which was furnished by the Armstrong Machinery Co., Spokane, Wash.

**The Frick Ice and Refrigeration Co., Montreal,** have been awarded a contract by Canadian Explosives, Ltd., Montreal, for an 8-ton refrigerating machine, to be installed at Nobel, Ont.

**The Frick Ice and Refrigeration Co., Montreal,** have sold a 15-ton refrigerating machine to Curtis & Harvey, Ltd., Rigaud, Que., and a 10-ton machine to the Elmhurst Dairy, Montreal.

## Marine

**Victoria, B.C.**—At the end of the present month, the breakwater will be complete, and early in January will be turned over by the contractors, Sir John Jackson, Ltd., to the Dominion Government.

**Sarnia, Ont.**—The steamer Harmonie has arrived in port on her last trip of the season, and will go into winter quarters with the other steamers of the fleet already here, the Noronic and Huronic.

**Sarnia, Ont.**—The Ferry Company will shortly have another boat on the ferry line between Port Huron and Sarnia, having purchased the steamer City of Cheboygan, which formerly plied out of St. Ignace.

**Ottawa, Ont.**—Colonel W. P. Anderson, chief engineer of the Marine Department has left for Midland, Ont., to organize, if necessary, an ice-breaking service for Canadian lake navigation. It has been represented to the department that a number of vessels loaded with grain are due to reach Midland and that ice may interfere with their arrival. Col. Anderson will be on hand in such an eventuality.

**Stelco High Speed Steel**, the latest and best out, the only high speed steel containing Treoxide, the new discovery. 30 per cent. better than tungsten. All sizes delivered promptly, annealed or unannealed.

**Our Titanium Tool Steel** for all round tool work, such as punches, dies, shears, snaps, chisels and blacksmith's tools.

**Our Chrome Manganese for hot work**, is just the thing for hot shell punching and hot rivet dies, etc.

**Our Silver Steel Drill Rod** is the most accurate to size and best in quality. Also machinery steel, in any quantity in car load lots if desired, also Crucible Machinery Steel. Let us serve you.

**The NEW METAL STEEL COMPANY, Sebago Lake, Me., Boston and New York**  
General Office and Works, Sebago Lake, Me.

## Machine Tools For Sale

IN STOCK FOR IMMEDIATE DELIVERY

### LATHES.

- 1-20 x 10 New Haven, plain change, compound rest (new).
- 1-18 x 8 Mueller Dbl. Back Gear, quick-change (new).
- 1-16 x 8 Hamilton Quick-change Gear (new).
- 1-14 x 6 Hamilton Quick-change Gear (new).
- 1-14 x 6 Hamilton Quick-change Gear, taper attachment (new).
- 1-14 x 6 Hamilton Quick-change Gear, taper attachment, pan bed (new).
- 1-14 x 6 Hamilton Plain Quick-change Gear (new).
- 2-13 x 6 Worcester Plain Quick-change Gear (new).
- 1-9 x 12 Porter Cable, compound rest (new).
- 1-11 x 5 Blount Speed Lathe (new).

### TURRET LATHES.

- 2-21" Gisholt Style H Turret Lathes.
- 1-12" W. & S. Plain Turret Lathe.
- 1-2 x 24 Jones & Lamson Geared Head Flat Turret.

### BENCH LATHES.

- 2-No. 5½ Sloan & Chace, cpd. slide, 3-speed cs., 10 collets (new).

### SCREW MACHINES.

- 1-2" Geared Eric. Head Power Feed to Turret (new).
- 1-1½" Geared Eric. Head, Power Feed to Turret (new).
- 2-1" Plain Head, wire feed (new).
- 2-9-16" Plain Head, wire feed (new).

### BENCH MILLER.

- 1-No. 2 Sloan & Chace Tool Room, index centers and vise (new).

### PUNCH PRESSES.

- 2-No. 5 Toledo Open-back Presses (new).
- 2-No. 2½ Toledo Open-back Presses (new).
- 1-No. 4 Baxendale (new).
- 1-No. 3 Zeh & Hanneman Inclined Press.
- 1-No. 68N Bliss Press.

### MILLING MACHINES.

- 1-No. 12 Garvin Plain Miller (new).
- 1-No. 0 Rockford Plain Miller (new).
- 3-Standard Hand Millers, vise and arbors (new).
- 1-No. 15 Garvin Plain (new).
- 1-No. 2 Plain Cincinnati.
- 1-No. 2 P. & W. Lincoln Type.

### DRILL PRESSES.

- 2-20" Barnes, sq. base, lever and worm feed (new).
- 1-20" Barnes sq. base, B.G., S.F. and A.S. geared taper (new).
- 1-3-quindio Avey Ball-bearing (new).
- 6-Mvers Sensitive Bench Drills (new).
- 3-Barnes Sensitive Bench Drills, friction (new).
- 2-20" Buffalo R.G. (new).
- 1-36" Aurora Sliding Head, Geared Tapper.
- 1-24" Aurora Sliding Head.

### TOOL ROOM GRINDERS.

- 1-Capital Internal Grinder (new).
- 1-No. 2 Harford Surface Grinder (new).
- 1-Steno. Surface Grinder, Duplex, 2 magnetic chucks (new).

### GRINDERS.

- 2-6 x 32 Norton Plain Grinders.
- 2-8" Blount Grinders (new).
- 2-10" Blount Grinders (new).
- 1-12" Blount Grinders (new).
- 2-No. 6T Sterling Grinders (new).

### WALL RADIAL.

- 1-Canedy-Otto 3½ ft. (new).

### CHUCKING LATHE.

- 1-7 x 14 Potter Johnson Automatic.

### MISCELLANEOUS.

- 1-4" Whiton Centering Machine.
- 1-10" Pratt & Whitney Traveling Head Shaper.
- 1-6" Boynton & Plummer Shaper.
- 1-No. 2 Hawk-Eye Helve Hammer.

### COLD ROLLED STEEL.

We have an extremely large stock of new, round, flat, square and hexagon in our Rochester warehouse. Write for quotations on immediate deliveries.

We have been in the machine tool and supply business for 20 years, and believe that we can serve you to your advantage.

**STRONG & HERY CO.**

225 State St. ROCHESTER, N.Y.

## Electrical Units

1-250 K.W. General Electric Continuous Current D.C. Generator, 225 volts. Direct connected to a 16 x 26½ x 20 Skinner Automatic Compound Engine. Speed 200 RPM. This unit is complete with Grey Marble Switchboard, Hand Meter, Circuit Breaker and Field Rheostat, etc.

1-125 K.W. Westinghouse D.C. Generator, 220 volts. Direct connected to a 17 x 20 Skinner Simple Automatic Engine. Speed 210 R.P.M. This unit is complete with Switchboard, Circuit Breaker, Field Rheostat, etc.

1-250 K.W. Westinghouse Belt Driven Generator, 550 volts, 455 Amp., 450 R.P.M.

1-250 K.W. Western Belt Driven Generator, 550 Volt, 455 Amp., 500 R.P.M.

1-90 K.W. Woods Belt Driven Generator, 6 Pole, 220 volts, 360 Amp., 750 R.P.M.

ALL THE ABOVE FOR IMMEDIATE DELIVERY.

**Riverside Machinery Depot**

25-29 St. Aubin Ave.  
DETROIT, MICH., U.S.A.

## Wanted A Photographer

Young man with experience in photographing machinery. One possessing technical education preferred. A knowledge of advertising would prove valuable. When applying, give full particulars re experience, age, where employed now, salary expected. Splendid opening for hustler. Replies will be treated in strictest confidence. Address Box 249, Canadian Machinery.

## MACHINE TOOLS

### LATHES.

- 1—28 x 15 Putman Standard Engine Lathe, C.R., S.S., I.F.
- 1—22 x 14 Putman Standard Engine Lathe, C.R., S.S., I.F.
- 1—18 x 36 x 10" LeBlond Extension Bed Engine Lathe.
- 3—(New) 7 x 60 Fitchburg Lo-Swing Lathes, with 2 tool taper att.
- 1—(New) 18 x 8 Reed-Prentiss D.B.G. Engine Lathe.
- 1—18 x 8 Jones & Lamson Engine Lathe.
- 2—16 x 6 Barnes Engine Lathes.
- 1—16 x 8 Cincinnati Engine Lathe.
- 1—16 x 6 Walcott Engine Lathe.
- 1—16 x 6 Reed Engine Lathe.
- 1—16 x 8 Porter Engine Lathe.
- 1—14 x 6 Lodge & Shipley Engine Lathe.

### MILLING MACHINES.

- 1—(New) No. 26 Ohio Milling Machine.
- 1—No. 3 Chicago Hand Miller.
- 1—No. 12 P. & W. L.T. Miller.
- 4—No. 13 P. & W. L.T. Millers.
- 1—Warner & Swasey Profiler.

### GRINDERS.

- 1—No. 2 Bath Universal Grinder.
- 2—12 x 36 Landis Plain Geared Head Grinders.
- 1—No. 5 Springfield Oscillating Surface Grinder.
- 1—No. 2 Gardner Disc Grinder.
- 1—No. 34 Gardner Double Disc Grinder.

### PLANERS.

- 1—Pond 62" (widened pattern type), 9' bed.
- 1—36 x 36 x 10 Industrial Planer, one rail head and one side head.

### TURRET LATHES.

- 1—No. 6 Foster Friction Geared Hand Screw Machine.
- 1—3 x 36 Jones & Lamson, with bar and chucking attachment.
- 1—2 x 24 Jones & Lamson, with bar and chucking attachment.
- 2—(New) No. 4 B. & O. Chucking Turret Lathes.
- 1—(New) No. 4½ B. & O. Hand Screw Machine, wire feed.
- 1—No. 4 Warner & Swasey Friction Geared Hand Screw Machine.
- 1—14" B. & O. Chucking Machine.
- 1—No. 5 Pearson Hand Screw Machine.
- 1—1 x 8 Pierce Hand Screw Machine (new).
- 1—2" Cleveland Automatic Screw Machine (Model A).
- 2—2" Cleveland Jigger Feed Screw Machines.

### AIR COMPRESSORS.

#### Steam

- 1—12 x 12 x 12½ x 12 Ingersoll-Rand, Class M.F. 1.
- 1—16 x 18 x 12 D.A. Union, S.L., 2 S., Air Compressor.
- 2—8 x 8" Westinghouse.

#### Belt.

- 2—10 x 10 Bury Hor. Belt Driven (182 C.F.)
- 1—10 x 10 Curtis Vertical D.C., with base (160 C.F.).
- 1—8 x 8 Ingersoll-Sergeant Hor. (103 C.F.).
- 1—8 x 8 Chicago Pneumatic Hor. (100 C.F.).

### DRILLS AND SLOTTERS.

- 1—(New) No. 61B Harrington Multiple Spindle Drill Press, 19 spindles.
- 1—(New) No. 51A Harrington Multiple Spindle Drill Press, 10 spindles.
- 1—(New) No. 51B Harrington Multiple Spindle Drill Press, 8 spindles.
- 4—(New) No. 61B Harrington Multiple Spindle Drill Presses, 16 to 33 spindles.
- 3—(New) 26" Buffalo Drills, W. & L.F.
- 1—17-spindle Moline.
- 1—5-spindle Barnes.
- 1—24" Niles Geared Slotter.

### GEAR CUTTERS.

- 2—11" Gleason Gear Generators.
- 1—12" Becker-Brainard Automatic Gear Cutter.
- 1—17" Newark Spur Gear Cutter.

### PRESSES AND HAMMERS.

- 1—No. 64 Toledo S.S., B.G.
- 1—No. 95 Consolidated Press.
- 2—Briscoe S.S., 7" stroke.
- 2—1200-lb. B. & S. Roll Board Hammers.
- 1—800-lb. B. & S. Roll Board Hammer.
- 1—1200-lb. Toledo Roll Board Hammer.

We carry a large line of Boilers, Pumps, Engines, Generators, etc.

In these High-cost days of New Tools---perhaps some of these

## MODERN USED TOOLS

will be of interest to you—Many of them still set up just as they had been used.

### UPRIGHT BORING AND TURNING MILLS.

- 12" Swing, Double-head, with Motor, and Countershaft, "Bullard."
- 12" Swing, Double-head, Speed-box, C-shaft, etc., "Colburn."
- 65" Swing, Double-head, with Motors and Countershaft, "Betts."
- 80" Swing, Double-head, heavy, "Pond Machine Tool Co."
- 86" Swing, Double-head, with C-shaft, "Niles Tool Works."
- 16' Swing, heavy, Motor-driven (10' under rail), "Niles Tool Works."

### LATHES.

- 16" Swing, 6' bed, "Reed," Hollow-spindle, Cpd. Rest, etc.
- 18" Swing, 8' bed, "LeBlond," Hollow-spindle, Cpd. Rest, etc.
- 18" Swing, 12' bed, "Schumacher & Boye," Cabinet legs, Hollow-spindle, etc.
- 20" Swing, 14' bed, "Hamilton," Quick-change, Hollow-spindle, etc.
- 20-48" Swing, 18' bed, Taper att., "McCabe," Double-spindle; latest.
- 28" Swing, 36' bed, Compound-rest, Hollow-spindle, "Fay & Scott."
- 52" Swing, 28' bed, Triple-gear, "Putnam Machine Co."
- 62" Swing, 24' bed, Triple-gear, "New Haven Mfg. Co."

### RADIAL DRILLS.

- 7' Arm, heavy, with Motor-drive and Motor, complete, "Niles Tool Works."
- 7' Arm, heavy, with C-shaft, etc., "Baush Mch. Tool Co."
- 5' Arm, heavy, Speed-box, "Dreses Machine Tool Co."
- 5' Arm, heavy, with C-shaft, "Pond Mch. Tool Co."

### TURRET LATHES.

- 2 x 24" Flat Turret Lathes, "Jones & Lamson," Sliding-head.
- 2 x 24" Flat Turret Lathe, "Jones & Lamson," Sliding-head, arr. for Motor.
- 20" Swing, full-automatic, "Potter & Johnston."

### HORIZ. BORING AND DRILLING MACHINE.

- 15-16" bar, with outside Yoke support, "Knee type" Blincoe style.

### PLANERS.

- 26" x 26" x 6', one head, "Pratt & Whitney."
- 32" x 32" x 8', two heads, "Pond Mch. Tool Co."
- 36" x 36" x 12', two heads, "G. A. Gray Co.," Frog and Switch.
- 48" x 48" x 14', two heads, "Niles Tool Works."

### VERTICAL MILLING MACHINES.

- 60" Bement-Miles & Co.'s, extra heavy.
- 42" Niles Tool Works, heavy.

### MILLING MACHINES

#### "Planer Type"

- 37" x 14' Horizontal spindle, "Bement-Miles & Co.'s."
- 36" x 8', Vertical spindle only, "Newton Mch. Tool Co."
- 24" x 6', Horizontal spindle, "Ingersoll Milling Machine Co."

### MULTIPLE SPINDLE DRILLING MACHINES.

- 18-spindle, cap'y 1" holes, with C-shaft, "Baush Mch. Tool Co."
- 16-spindle, cap'y 1" holes, arranged for Motor, "Baush Mch. Tool Co."

### PUNCHES AND SHEARS.

- 60" Throat, No. 6, "Hilles & Jones," arranged for Motor, heavy.
- 60" Throat, Horizontal, cap'y 1½" through 1¼", Bement-Miles; new.
- 36" Throat, cap'y 1" through 1", "Wm. Sellers & Co."
- 30" gap, Rotary Splitting Shears, "Lennox."
- 14" Throat, heavy, Standard.

## The Pick of the Country's Stock

### GRINDERS.

No. 1 Wilmarth & Morman Full Universal Grinder, complete with equipment; brand new	\$1,000
Two American Standard Universal Grinders, complete with full equipment and in very good operative condition, swings 8" with water guards, 8½" without water guards, takes 16" between centers each	1,000
No. 2 Woods Full Universal Cutter and Tool Grinder, with complete equipment; brand new; internal grinding attachment	625
No. 184 Wells Universal Cutter and Reamer Grinder; brand new	230
No. 210 Heald Piston Ring Grinder with 8" magnetic chuck, automatic feed; in first class shape	525
Gisholt Universal Tool Grinder; like new	300
No. 5 Bath Duplex Internal Grinder, complete and in very good condition	1,200
No. 6 Besley Double End Ring Wheel Grinder, with ring wheel chucks; like new	750

### MILLERS.

Twenty Brand New Whitney Two-step Cone Millers	each 250
Seven No. 7 Becker Lincoln Millers, in first-class condition	each 225
No. 20 Oesterlein Universal Millers, brand new; delivery March	1,500
No. 2 Becker Full Universal Miller, complete with regular equipment, brand new, no arbor, all power feeds; delivery latter part of this month	2,250

### LATHES.

55" x 12' Pratt & Whitney Screw-cutting Engine Lathe, triple geared, compound rest, power cross feed, solid spindle	1,200
32" x 8½' Filfield Screw-cutting Engine Lathe, triple geared, compound rest, power cross feed, no gears	700
24" x 16' Lodge & Shipley Quick-change Gear Lathe, taper attachment, 2" hole in spindle, compound rest, power cross feed, lot of equipment	1,550
22" x 16' Niles Screw-cutting Engine Lathe, compound rest, power cross feed, hollow spindle	650
18" x 18" 2" Putnam Screw-cutting Engine Lathe, power cross feed	650
18" x 12' American Quick-change Gear Lathe, compound rest, power cross feed, hollow spindle	1,000
18" x 8' LeBlond Screw-cutting Engine Lathe, compound rest, power cross feed, hollow spindle	750
16" x 8' Lodge & Shipley Screw-cutting Engine Lathe, quick-change gear, taper attachment, compound rest, power cross feed, hollow spindle	750
Three Brand New 14" x 6' Monarch Quick-change Gear Lathes, screw-cutting	each 600
Three Brand New 13" x 6' Seneca Falls Screw-cutting Lathe, actual swing 14"	485
Two Seneca Falls Brand New Screw-cutting Lathes, same as above, but with draw-in attachment and one ½" collet	each 535
12" x 6' Hendey Tool Room Lathe, quick-change gear, pan bed, compound rest, hand cross feed, automatic stop, hollow spindle, draw-in attachment, six collets	625
12" x 5' Pratt & Whitney Lathe, rise and fall rest, taper attachment, just taken from micrometer department	325
12" x 5' Fairbanks Screw-cutting Lathe, compound rest, power cross feed, hollow spindle	300
Two 12" x 4' Brand New Shepard Quick-change Gear Lathes	each 225

### SPECIAL

Fitchburg Lo-Swing Lathe, like new, complete with large equipment	\$ 900
24" x 12' Hendey-Norton Lathe, compound rest, power cross feed, hollow spindle, full swing rest with round six-hole tool post, automatic stop, tie bar head, quick-change gear, taper attachment, 18" four-jaw chuck, 24" and 14½" face plates, steady and follow rests; machine has not a scratch on it and is just as good as the day it was delivered from the factory; appearance and condition like new	1,900
21" x 16" Springfield "Ideal" Lathe, detachable, quick-change gear, complete equipment; in first-class condition	1,000
Fifty Heavy Duty Shell Boring Lathes, specially designed for boring and turning shells 8" to 16"; brand new	

### VERTICAL AND HORIZONTAL BORING MILLS.

36" Brown & Sharpe Vertical Chucking Machine, 8" square turret head on slide with 4 1½" holes	550
---	-----

### AUTOMATIC AND HAND SCREW MACHINES.

8½" x 16" Potter & Johnson Automatic, with large equipment, first-class condition	900
¾" National Acme, 4-spindle two-belt type	450
1" National Acme, 4-spindle two-belt type	650
1½" National Acme, 4-spindle two-belt type	850
Above three National Machines have not been overhauled, but with a few new parts and cleaning can be made first-class.	
Eight No. 12½ Brand New Garvin Friction Geared Head Screw Machines, 2" wire feed capacity, automatic feed to turret	each 875
25 Milwaukee Screw Machines, 1½" wire feed capacity, geared friction head	each 800
25 Warner & Swasey Type Screw Machines, 2" wire feed capacity, geared friction head	each 800
Ten No. 2 Toledo Brand New Screw Machines, 1 1-16" wire feed capacity	each 675
6" Cleveland Full Automatic, capacity 8", 4 1½" holes in turret, 6¾" length can be milled, length of stock feed 7"; first-class condition	3,000

### DRILLS.

24" Cincinnati Heavy Pattern Upright Drill with patent geared type attachment; like new	425
Twenty Brand New Sigourney Single Spindle Drills, high-grade machines	each 100
Ten Two-spindle, same type as above	each 165
Ten Brand New No. 6 Burke Bench Drills, 10" swing	each 15
24" Baker Bros. Drill, single pulley drive; like new	550

### SHAPERS.

16" Smith & Mills Crank Shaper	375
24" Gould & Eberhardt Back-geared Crank Shaper	600
16" Parker & Chari Geared Crank Shaper	375
16" Springfield Back-geared Crank Shaper, heavy pattern	425

# Quick Service on Your Orders

We can make immediate shipment on large and small orders for:

Bars	Sheets	Turnbuckles
Angles	Rails	Boiler Tubes
Tees	Spikes	Transmission
Channels	Bolts	Machinery
Beams	Rivets	Etc., Etc.
Plates	Nuts	

Let us have a copy of the first enquiry you may be sending out to the trade. We can offer you both price and service equal to, or better than that which can be obtained elsewhere.

## Send for Our Monthly Stock List

### *Advantages of Dealing With Us:*

Our stock is a complete range, enabling us in most cases to ship your order the same day as received. We will arrange wherever possible to include your order with carload lots, thus giving you the advantage of lower freight rates.

We follow each order through to its destination by our own tracing department.

The advantage of being able to secure your material in exactly the size you want saves you paying freight on waste; also the time and labor otherwise required for alterations.

# Look These Over

## SECOND-HAND LATHES.

- 16 x 6 American, Quick-change Gear, Geared Friction Head, Hexagon Turret and Power Feed.
- 14 x 6 American Quick-change Gear, with Hexagon Turret and Taper Attachment.
- 16 x 6 American Quick-change Gear, Geared Friction Head, Hexagon Turret.
- 14 x 6 American Quick Change Gear, Geared Friction Head, Hexagon Face Turret.
- 24 x 6 Reed Compound Rest and Turret.
- 13 x 5 Barnes, compound rest.
- 22 x 10 Davis Quick Change Double Back Geared.
- 18 x 7 Reed-Prentice, geared head, flat turret lathes, automatic stops and fitted with air chucks.
- 25 x 16 Old Style Lathe, good repair lathe.

## NEW LATHES.

- 13 x 6 South Bend.
- 15 x 6 South Bend.
- 16 x 7 South Bend.
- 18 x 6 South Bend.
- 46 x 8 Clisco, actual swing 18 3/4".
- 2-18 x 8 Clisco, Double Back Geared, actual swing 20 3/4".

## SECOND-HAND TURRET MACHINES.

- 14" Warner & Swasey Geared Friction Head, Automatic Chuck, Lathe with 9" air cylinder and chuck.
- 14" Warner & Swasey Geared Friction Head Turret Lathe, with air chuck and cylinder.
- 14" Warner & Swasey Turret Lathe with friction head, wire feed, oil pan and pump.

## NEW TURRET MACHINES.

Two each No. 1, No. 2, No. 3, No. 4, No. 5, No. 6 and No. 7 Foster Screw Machines with complete equipment.

## SECOND-HAND MILLING MACHINES.

Garvin No. 2 Hand Miller with vise and arbor.  
Pratt & Whitney No. 0 Hand Miller with vise and arbor.

## NEW MILLING MACHINES.

2 Standard Whitney Type Hand Millers, with lubricating equipment.

## SECOND-HAND DRILL PRESSES.

Barr 3-Spindle Gear Driven, 18" swing, No. 2 taper spindle.  
Barr 6-spindle, style "E," 18" swing, No. 2 taper.  
Henry & Wright 4-Spindle, Ball Bearing No. 2 taper.  
Barnes 10" Friction Sensitive Drill.

## NEW DRILL PRESSES.

- 1 Sipp 2-Spindle Ball Bearing.
- 1 Sipp 3-Spindle Ball Bearing.
- 2 Sipp 4-Spindle Ball Bearing.
- 1 Barnes 20" All Geared Self Oiling.
- 1 Hoefler 10" Friction Sensitive Drill.

## MISCELLANEOUS TOOLS.

- 2 Heavy Pattern Ranson Polishing Machines.
- 2 Kager 3-horse power, 60-cycle, 220-volt, 3-phase, 3,600 r.p.m. Polishing Motors with extended spindle.
- 2 4 1/2" Davis Cutting-Off Machines with 4.5 Air Chucks and vertical forming slide.
- 6 Holden-Morgan Thread Millers, designed for thread on 3" shells, to be sold in one lot.
- 2 West Tire Setter Bending Machines.
- 2 Watson-Stillman 1 1/2 x 2 Pumps, 1,200 cu. in. at 2,100 pounds pressure.
- 1 50-Pound Kane & Ronch Blacksmith Hammer.
- 1 18" Disc Grinder and Press.
- 1 Waterbury Farrel Sprue Cutter.
- 1 225 Light Onondaga Direct Current, 110 volt Dynamo.
- Barnes Self-Oiling All Geared Drilling Machines.
- Peerless 6" High Speed Hack Saw Machine.
- Sterling 3-A High Speed Hack Saw Machine.

**The H. A. Smith Machinery Co.**

## CAN'T BE BEATEN FOR PRICE AND QUALITY

### LATHES

- 2-14" New Champion Tool-room Lathes, with oil pan and pump, taper attachment.
- 1-20" New Heavy Duty American Tool Works Lathe, double back gear, quick-change gear.
- 2-18" x 8" New Double Back-gear, Quick-change Gear Lathes.
- 1-26 x 10 Used Whitcombe-Blaisdel Heavy Duty Engine Lathe, quick change gear, double back gear; in first-class condition.
- 1-24 x 14 Used Lodge & Shipley Engine Lathe, single back gear, quick-change gear; good as new.
- 1-24 x 1" Prentice Engine Lathe, with taper attachment, hollow spindle, compound rest; used, but in very good condition.
- 1-20 x 10 Used Bullard Engine Lathe, hollow spindle, compound rest; in good condition.

### DRILLS

- 1-34" Used Barnes Sliding Head Drill, back geared, power feed; first class condition.
- 2-24" Foot-Bart Heavy Duty Drills; used.
- 1-2-Spindle Reed Sensitive Drill; used.
- 1-Spindle Reed Sensitive Drill; used.
- 1-26" Back-geared Davis Drill; used.

### MISCELLANEOUS

- 1-18" New Barker Back-geared Shaper.
- 1 4 1/2 Brown & Sharp Full Universal Miller, single pulley drive; four years old.
- 1-24 x 24 x 6 Lodge & Davis Planer; in first-class condition.
- 1-24 x 24 x 8 Whitcombe-Blaisdel Planer; in first-class condition.
- 1-9" Cut-off Machine; new.
- 2-New Dominion Universal Grinders.
- 1-Second-hand 75 H.P. Motor, 25 cycle, 3 phase, 560 volts; Canadian General Electric make, complete with starter.

Our used machinery is sold on its own merits. We buy nothing but machines that are really good. Every machine is rebuilt.

## Don't Keep It--Sell It!

If you have a lathe  
a drill  
a milling machine  
a planer  
a chain block  
a chuck  
a motor  
a crane  
a stock of belting  
an engine  
a compressor

or any other machine shop equipment for which you really have no further use, why not turn it into cash?

Someone may be looking for just the machine you may want to sell. Let us bring you together.

A "classified" ad. in CANADIAN MACHINERY, costing a few cents per issue, has done wonders for others. Why not try it?

Turn to the "Classified" section in this issue and see what is being offered and what is wanted at present.

## Second-Hand Machinery List

Besides having a complete machinery equipment for sale, for manufacturing 18-pdr. British Shrapnel Shells, we have available the following machines:—

### AUTOMATICS

2" Cleveland  
Reed-Prentice Semi-Automatic Lathe  
Potter & Johnson 6-A

### BORING MILLS

24" Bullard V. T. L. (New).  
No. 2 Baker Cylinder Borer.

### DRILL PRESSES

Baker Brothers Two Spindle 1" x 6" Semi-Automatic.  
4' Baush Radial  
24" Cincinnati Upright

### KEYSEATERS

No. 0 Baker.  
No. 2 Baker.

### LATHES

14" x 6' Fay & Scott (New).  
18" x 8' Davis Three Step Cone D. B. G.  
20" x 10' Bridgeford Quick Change.  
22" x 14' Davenport.  
26" x 12' Bridgeford Three Step Cone D. B. G.  
Tindell-Morris Crankshaft.

### TURRET LATHES

24" Gisholt's (with 6¼" and 5¼" holes).  
21" Gisholt's (with 2½" holes).  
11½" Bardons & Oliver.  
1" Foster-Kimball.  
7/8" Garvin.  
1" Warner & Swasey.

The above being a partial list of our stock, would ask that you advise us your needs.

Assuring you that all inquiries will have our best attention.

## New and Second Hand Machinery

### BORING MILLS.

Rochester 3½" Bar Floor Type Motor Driven.  
42" Niles Vertical, 2 Heads and Boring Head Geared Feed.  
34" Colburn Vertical, Turret Head, all Geared Feed.  
28" Bullard. Actual Swing 34".

### RADIAL DRILLS.

2½' foot Muller, Cone Drive.  
3 foot Bickford, Belt Feed.  
3 foot Bickford, Single Pulley Drive.  
3 foot Gang, Cone Drive.

### SHAPERS.

16" Smith & Mills.  
16" American. Back Geared.  
20" Smith & Mills.  
24" Barker, New.

### TURRET LATHES SCREW MACHINES.

1—No. 1 Pratt & Whitney, Wire Feed.  
2—No. 1 Garvin, Wire Feed.  
1—No. 2 Garvin, Wire Feed.  
28" Gisholt.  
24" Steinle.  
2—2 x 24 Jones & Lamson Single Pulley Drive, Bar and Chucking equipment.

### POWER PRESSES.

8—No. 18 Bliss Presses, Inclineable.  
4—No. 1 V. & O. Inclineable.  
3—No. 1 V. & O. Inclineable, Double Action.  
1—Press Equal No. 23 Bliss 4 inch Stroke Inclineable, Weight 10,000 lbs.  
Stiles No. 3 Power Press.

### MILLING MACHINES.

Garvin No. 3 Hand Miller.  
Backer No. 5 Vertical Miller.  
Miller & Crowningshield Hand & Power Feed Miller.

### LATHES.

1—10 x 4 Champion, Compound Rest, Hollow Spindle, Power Cross Feed.  
1—12 x 5 Fairbanks, Compound Rest, Hollow Spindle, Power Cross Feed.  
1—13 x 5 Seneca Falls, Compound Rest, Hollow Spindle, Power Cross Feed.  
3—14 x 6 Carrol Jamison, Compound Rest, Hollow Spindle, Power Cross Feed.  
1—15 x 6 Blaisdell, Compound Rest, Hollow Spindle, Power Cross Feed.  
1—14 x 6 American, Quick Change Gears, Compound Rest, Hollow Spindle, Power Cross Feed.  
1—16 x 6 Prentice, Compound Rest, Hollow Spindle, Power Cross Feed.  
1—16 x 8 American, Quick Change Gears, Compound Rest, Hollow Spindle, Power Cross Feed.  
2—16 x 6 Schumacher & Boye, Compound Rest, Hollow Spindle, Power Cross Feed.  
1—17 x 8 Blaisdell, Compound Rest, Hollow Spindle, Power Cross Feed.  
1—15 x 6 Putnam, Compound Rest, Hollow Spindle, Power Cross Feed.  
1—16 x 6 Prentice, Compound Rest, Hollow Spindle, Power Cross Feed.  
1—18 x 8 Bradford, Compound Rest, Hollow Spindle, Power Cross Feed.  
1—18 x 12 Schumacher & Boye, Compound Rest, Hollow Spindle, Power Cross Feed.  
1—19 x 16 Greaves Klausman, Compound Rest, Hollow Spindle, Power Cross Feed.  
1—20 x 8 Le Blond, Compound Rest, Hollow Spindle, Power Cross Feed.  
4—22 x 10 Lodge & Davis, Compound Rest, Hollow Spindle, Power Cross Feed.  
1—14 x 8 Lodge & Shipley, Quick Change Gears, Taper Attachment.  
3—16 x 6 Simplex, Compound Rest, Hollow Spindle, Power Cross Feed, New.  
1—16 x 6 F.E. Reed, Compound Rest, Hollow Spindle, Power Cross Feed.

### MISCELLANEOUS.

1—41 x 41 x 13 foot New Haven Planer, Single Head.  
1—No. 2 Oesterlein Universal Grinder.  
1—4 Spindle Acme Nut Tapper.  
1—4 Spindle Baker Mfg. Drill.  
1—5 Spindle Adjustable Foot Burt Drill.

SUCCESSORS TO

## The Co-Operative Used Machinery Company

Success is such a simple thing after all. All that is necessary is to *KNOW YOUR BUSINESS*. We're not so old, to have gone to seed. Not so young, to be an experiment. Just 25 years of practical experience in the used machinery business—*At your service*. Used machine tools principally of class and distinction. We stock every size, make and description of

### MACHINE TOOLS

Note the following samples which indicate our *HIGH CLASS STOCK*.

#### LATHES.

21" x 8' 6" Fitchburg, back-gear, 4-step cone, 2 1/2" belt, plain rest, rod and screw feed, screw in back, 61" between centers	\$ 175
21" x 12' Fifield, back-gear, 4-step cone for 3" belt, C.R., P.C.F., rod and screw feed, screw in back, 9' between centers, 19" and 9" face plates, steady rest, gears, cabinet legs	375
22" x 9' Reed, 1 1/2" H.S., 5-step cone for 3" belt, 20" face plate, C.R., P.C.F., 60" between centers	500
22" x 8' Niles, 1 1/2" H.S., 3-step cone, 3" belt, back gear, friction head, C.R., P.C.F., Q.C.G., 50" between centers with 22" dia. chuck, steady rest	425
22" x 10' Blaisdell, back-gear, 4-step cone, 3" belt, C.R., P.C.F., belt feed, rod and screw in front, taper attachment, set over tail stock, 60" between centers, 18" four-jawed chuck	375
Three 24" x 10' Lodge & Shipley, Q.C.G., 2" H.S., 5-step cone, 3 1/2" belt, C.R., P.C.F., 60" between centers, cabinet legs, each	1,100
24" x 16" Harrington, 4-step cone, 3 1/2" belt, back-gear, C.R., P.C.F., 12" between centers	650
Four 24" x 8' Lodge & Shipley, Q.C.G., 1 1/2" H.S., 5-step cone for 3" belt, C.R., P.C.F., 22" face plate, cabinet legs, each	1,000
24" x 12' Jones & Lamson, 2" H.S., back-gear, 4-step cone, 3 1/2" belt, C.R., P.C.F., rod and screw feed, screw in back, 90" between centers, with 24" face plate, 22" four-jawed independent chuck	1,200
24" x 13' New Haven, 2" H.S., back-gear, 5-step cone, for 3 1/2" belt, 24" face plate, C.R., P.C.F., cabinet legs, 65" between centers	550
24" x 12' Harrington, back-gear, 4-step cone for 3" belt, C.R., P.C.F., 96" between centers, 21" four-jawed chuck, 24" face plate	500
Seven 24" x 12' Lodge & Shipley, 1 1/2" H.S., 5-step cone, 3 1/2" belt, back-gear, Q.C.G., C.R., P.C.F., cabinet legs, 82" between centers, with 24" face plate, steady rest, each	1,200
24" x 10' Reed, back-gear, 5-step cone, 3 1/2" belt, compound rest, power cross feed, rod and screw feed, taper attachment, 64" between centers	675
24" x 12' Lodge & Shipley, 2" H.S., 5-step cone, 3 1/2" belt, back-gear, C.R., P.C.F., Q.C.G., 78" between centers	1,200
24" x 12' New Haven, back-gear, 4-step cone, 3" belt, plain rest, 100" between centers with 21" face plate	III
25" x 12' Fitchburg, 4-step cone, 3 1/2" belt, back-gear, C.R., P.C.F., extra turning rest	500
26" x 18' Fifield, 4-step cone, 4" belt, back-gear, 26" face plate, C.R., P.C.F., 13" between centers	1,000
26" x 12' Prentiss, 1 1/2" H.S., P.C.F., offset tail stock, 70" between centers, with 11" and 24" face plate, cabinet legs	1,000
26" x 18' American Tool Works, 5-step cone for 3 1/2" belt, 2" H.S., back-gear, C.R., P.C.F., 13" between centers	1,500
29" x 9' Powell, 4-step cone, 4" belt, plain rest, 50" between centers with 26" face plate, P.C.F.	350
29" x 12' Niles Tool Works, back-gear, 5-step cone, 3 1/2" belt, C.R., P.C.F., 82" between centers	850
29" x 14' Putnam, sliding bed, 2" H.S., back-gear, 5-step cone, 4" belt, C.R., P.C.F., will swing 57" in gap, lathe bed will slide 6" on base; max. distance between centers 160"; complete with gears	1,500
32" x 15' Nicholson & Waterman, 1 1/2" H.S., back-gear, 5-step cone, 4" belt, 26" four-jawed independent chuck, C.R., P.C.F., cabinet legs, taper attachment, 102" between centers with steady rest	1,250
34" x 14' Gleason, double back-gear, 4-step cone, 4" belt, C.R., P.C.F., 96" between centers with 18" and 36" face plate	1,400
36" x 20' Lodge & Davis, heavy pattern, 5-step cone, for 4 1/2" belt, 2 1/2" H.S., rod and screw feed, C.R., P.C.F. to compound rest, 26" four-jawed chuck, reinforced bed	2,350
39" x 14' New Haven, heavy pattern lathe, back-gear, 5-step cone, 4 1/2" belt, C.R., P.C.F., 106" between centers with 38" face plate, steady rest	1,500
42" x 20' Woodliffe & Co., takes 15" between centers, C.R., P.C.F., face plate, 4-step cone, countershaft, tight and loose pulleys	1,500
100" x 30' Niles, 5-step cone, 5" belt, face plate drive, 14" face plate with T slots and holes for bolts, C.R., P.C.F., 9" spindle, will take 16" between centers	5,000
84" x 27' Putnam, C.R., P.C.F., takes 16" between centers, motor driven	3,500

#### HORIZONTAL BORING MILLS.

Beaman & Smith 5" bar, bores to center of 60", travel of bar by power 60", motor driven, with variable speed motor	1,500
Sellers Double Spindle, has two hor. spindles 57" dia.; distance between uprights 6'; height, top of table to center of bars 18"; minimum distance between centers 10"; between bars 24"; each bar has 3	

cutter slots, and is driven independently by 5-step cone through gears, 3" belt; table is 50" long, 36" wide, with 8 T slots, hand and power feed, power feed to table in line with spindle, travel of table in line with spindle, travel of table in line with spindle 36"

#### VERTICAL BORING MILLS.

No. 1 Brown & Sharpe Chucking Machine, 28" table, single head, 9" dia. turret, five 1 1/2" holes; 5-step cone, 2 1/2" belt	300
No. 2 Brown & Sharpe Chucking Machine, 36" dia. table, 5-step cone for 3" belt, friction feed, 10" turret, six 1 1/2" holes, 17 1/2" max. distance under head	450
Two 30" Bullards (turret head), each	700
30" Bullard	500
54" Industrial, one head on cross rail, 3 independent jaws on table, max. distance between table and cross rail 36"	500
42" Niles, 2 swivel heads	1,250
13' Pond, actual swing 11' 5", table 8' dia., height under cross rail 6', cross rail 24" wide, belt driven, powerfully back-gear, 7-step cone, 5" belt, friction feed	5,500

#### MILLING MACHINES.

No. 13 1/2" Garvin, back-gear, 4-step cone, 2 1/2" belt, power feed, 36" x 12" table, 5" swivel vise	700
Kemp Smith, 3" x 36" table, 3-step cone, 3" belt, back-gear, power feed	800
No. 21 Garvin plain, 6" x 30" pan table, T slots, 3-step cone, 3 1/2" belt, power feed	200
Two Pratt & Whitney Lincoln Type, with 3-step cone for 3" belt, belt feed, 2" driving spindle for cutters, 7" x 28" table, max. distance between housing and outboard stand 18"; max. height of cutter arbor over table 10"; each	150
Pratt & Whitney Lincoln Type, 3-step cone for 3" belt, belt feed, 2" driving spindle for cutters, 7" x 28" table, max. distance between housings and outboard stand 18"; max. height of cutter arbor over table 10"	250
No. 9 Kemp Smith plain, back-gear, 3-step cone, 3" belt, 4" arm, 12" x 36" table, 3 T slots, power feed	750
No. 3 Kemp Smith plain, old style, back-gear and cone reversed, table 7" wide, 34" long, 3 T slots, supplementary table on top about 1 1/2" thick, 3 T slots, 5-step cone, 3" belt, power length feed only	300
Brown & Sharpe plain, 3-step cone for 2 1/2" belt, 8" x 3" table	200
Brown & Sharpe Universal, 4-step cone, 3" belt, no overhanging arm, table 5" wide, 28" long, one T slot, 3 changes power feed, table feed about 18"; transverse feed 4 1/2" vertically	330
Lodge & Davis, 3-step cone, 3" belt, back-gear with 6" x 32" table, power feed	950
Brown & Sharpe, 2-step cone, 3" belt, sliding head, 1" x 4' table, geared feed, worm gear drive	700
No. 9 Garvin Mfg. Type, with 3-step cone for 2 1/2" belt, back gear, 7 1/2" x 29" table, pump, power feed, max. distance between table and cutter arbor 8"	275
No. 0 Pratt & Whitney Power, 4-step cone, 2 1/2" belt, 5" x 24" table, power feed	225
Seven No. 12 Brown & Sharpe Mfg. Type, 3-step cone for 2 1/2" belt, back-gear, power feed, 6" x 36" pan table, each	300
66" x 51" x 3' Ingersoll Hor. ## Madison-Kipp Lubricators are Valveless

THEY ARE CONSTRUCTED ON THE KIPP NO-VALVE PRINCIPLE WITHOUT SPRING AND BALL CHECKS.

THE PERFORMANCE IS UNQUESTIONABLY POSITIVE. THE OIL CONSUMPTION IS ABOUT ONE-HALF.

MORE MADISON-KIPP FORCE FEED LUBRICATORS ARE PRODUCED EACH YEAR THAN ALL OTHER MAKES COMBINED.

**Madison-Kipp Lubricator Co.**  
Madison, Wis., U. S. A.

## COLBURN HEAVY DUTY DRILL PRESS

*"The machine  
with the  
BACKBONE  
and speed"*

Proof of the Drill Press is in the drilling of shells.

None but a machine that is built for power, stiffness and rigidity can stand the strain of constant drive, drive, drive on shell work. **"Colburn" Drill Presses will increase your output of shells** or any other work because its rigidity permits driving drills at highest speed — its drilling capacity being really only limited by the endurance of the drill.

There is positively no spring, drill breakage is small and drills wear long between grinds.

Arranged for belt or motor drive.

JOT DOWN A LINE FOR FULL DETAILS

**Colburn Machine Tool Co., Franklin, Pa., U.S.A.**

# Milling Cutters    Milling Machines Relieving Machines

In addition to a standard line of milling cutters we are equipped to handle special cutters for making rifle and machine gun parts, also thread hobs for shell work.

Cleveland, Ohio

# The "SAMSON" Railway Car Mover

Every railway siding should be supplied with one of these tools. Takes the place of fifteen men and puts the heaviest loaded car just where you want it. It will pay for itself in 30 days.

Cut on the left shows position of mover before moving car and cut below after car has been moved.

It is one of the most simple and powerful devices for moving cars by hand.

It is provided with **Never Slip Spurs**, which is the most important feature on a Car Mover.

It is very easy to move a car if the Mover does not slip back. By the use of our double spur we get a double hold on the rail and thereby double the resistance, which is the most essential part of a Mover. You will notice that the working parts of this device are not connected by rivets and links which are constantly wearing out and breaking. One bolt connects all working parts. It is so constructed that when car is just started you have the most leverage, and it gains speed as the lever is depressed. We claim that our Mover will work under a lower brake than any other Mover.

It is so constructed that when the handle is raised to push the Mover forward it raises the spur from the rail, which protects the spur from being dulled. This does away with all springs and rollers, which are only a nuisance.

It has no equal and stands superior to anything else in the market.

Select Northern hard maple handles make it light and handy. Malleable castings make it light and strong. The spurs or heels are made of special tool steel. We guarantee malleable parts six months.

**If your jobber cannot supply you, write us direct**

**Special attention given to Export Orders**

It has two four-cornered spurs, which catch the outer edges of the rail, where rail is soft, and not where other movers do, on top of the rail where it has become case-hardened from the wear the car wheels, as shown in lower right-hand cut. The spurs can easily be driven out and turned as edges get dull.

OUR NEW "SAMSON" CAR MOVER.

## Eliminate Expensive Compressed Air and Intricate Machinery by Installing MOLINE HAND SQUEEZERS

The Moline Hand Squeezer entirely eliminates the high cost of compressed air.

All working parts are above the table and sand cannot get into the mechanism, causing destruction or deterioration.

While fully as efficient as any molding machine or squeezer on the market, it requires less floor space.

The parts are made of steel, malleable iron and semi-steel castings, thus insuring long, economical service.

The swinging arm, balanced on the steel centers, can be swung to the right or left by a slight motion of the hand, making it convenient for *bench molding* as well as *squeezer work*.

*Make more molds for less money in much less time.*

The Moline Hand Squeezer is easier and faster in operation than any other hand squeezer. It will greatly increase your capacity, reduce your costs and enable your molders to increase their earnings.

You can use on this machine, flasks varying in sizes from 9" to 16" in width, by 10" to 25" in length, and any depth can be used by lowering or raising the molder's bench.

# KEYSEATS

## INTERNAL

### Milled by Rotary Cutter

A drilling machine attachment that can be used in shops large and small. It mills keyseats in places where shaper, planer and keyseating machine can't reach. This is the right tool to use for milling keyseats for interchangeable parts. The tool is fitted with a high-speed steel cutter for milling internal keyseats in one cut. To complete a keyseat it is only required to pass the tool through the hole just once. Innumerable inexpensive eccentric bushings are supplied whereby the tool may be bushed to meet any diameter above its own. It can be made to mill internal keyseats for taper keys. Multiple keyseats exactly spaced can be milled with this attachment. Long length holes to be keyseated is a difficult job under any circumstances, while it is a simple operation with this tool. It is as simple as drilling a hole. This tool is a quantity producer and is used in shops where parts are keyseated by thousands. Blind holes, offset holes and taper holes can also be keyseated. There is no limit to the variety of internal keyseats that can be milled with this tool. It is chucked in the drilling machine and made ready for use as rapidly as any straight shank drill; taper shank is also supplied if required.

## THE REASON

This lathe is one of the reasons why the "Walcott Line" has for the past 35 years been considered to be the ideal line of lathes to obtain the maximum production with minimum cost.

The reason for that opinion will be easily seen because its construction is in entire accord with the latest designs, being a simple, strong and speedy unit with every safety factor possible included in its construction. Features include all-steel gears in apron, 32 feeds, 2 to 112 threads, quick-change gear changes quick-change speed; mechanism interchangeable parts.

Line includes lathes, from 14" to 28". Circulars give complete information.

# Sturtevant

(TRADE MARK)

## Fans, Fans Systems, Heating and Ventilating Apparatus

The Sturtevant Fan System will heat fresh air and distribute it to every corner of your factory. This means not only heating but also ventilation.

Factories which have a positive system of mechanical ventilation, attract and hold the highest grade help. The poorly ventilated factory which has no means of ventilation can only secure low grade help, with corresponding decrease in output and quality of workmanship.

Surely abundant fresh warm air in winter and fresh cool air in summer will increase the efficiency of your men—raising your output—as it has done in all shops where Sturtevant Heating and Ventilating Systems have been installed.

# Sturtevant

(TRADE MARK)

## Individual Heater Units for Shop Heating

Illustration shows small self-contained heating unit with turbine-driven disc fan. These units diffuse large volumes of warm air along the floor, and are ideal for heating shops, roundhouses, industrial buildings, pump-houses or oil-houses.

### ADVANTAGES:

Inexpensive—Self-contained—Require only one steam pipe—Exhaust steam from turbine used in coils—Can be moved by crane or truck to other location or plant—Can be readily sold—Belt-drive or motor-drive is readily possible.

No matter what you need in the way of heating or ventilating apparatus or fans, we can serve you. Write for our general catalog 195-I.

## Battery of Gortons "Doing Their BIT"

### Seven 6-inch Gorton Heavy Duty Cutting-Off Machines Installed in Plant of Dominion Iron & Steel Co., Limited, Montreal, Can.

THE DOMINION IRON AND STEEL CO. have fifteen 6" Machines—also THREE of our 13" Machines. In a letter received from them they express themselves regarding these machines, as follows:

"We have the most up-to-date Cutting-Off equipment on this Continent, which are turning out at the present time 12,000 tons shell blanks per month, cut into lengths ready for forging, being 3½ to 9" Rounds, all .55 carbon. The fine work done by your machines is the admiration of all who have had an opportunity of seeing them in operation."

General Superintendent C. S. Martin states: "We have seven of these machines, each operating about 22 hr. per day in the cutting of Mill Length Bars of 3½ in. diameter into 98½ in. Shell Blanks, each machine producing from 900 to 1,000 blanks daily. This output could be considerably increased by use of one of the High Speeds, but recent supplies of High-Speed Cutter Steel has rendered the operation of High Speeds inadvisable. Under normal conditions, and a better quality of High-Speed Steel available, we believe no difficulty would be experienced in increasing our output to 1,200 or 1,300 blanks per day.

"Up to the present, we have had very few mechanical defects in our cutting operations, the Machines standing up to the work very well."

This same firm has reordered FOUR TIMES since placing their first order

It is reasonable to claim that what these machines are doing for this, and many other firms throughout the world, they will do for you.

Decidedly, this is the only machine for shrapnel and shell work. Cost of production and repairs considered, is the cheapest tool of its kind there is. Built by a firm that has as its head one of the most capable machine and tool

designers in the country. The product of this shop has a decade of enviable record for actual performance and economy of operation. The very appearance of the machines shows their inherent strength.

In its present condition this tool is as perfect as mechanical skill and precision can make it, based on the actual building and testing out of various styles and types. The machine shown is exceedingly rugged in every detail, suitable for constant hard service continually, month in and month out, without excessive repair.

When severing a 6-in. ordinary round steel bar in 40 seconds there is absolutely no chatter or vibration. This means prolonged life of cutter—over 700 cuts without sharpening—a record hitherto unheard of.

Approximate cost per 100 blanks \$1.00 to \$1.05. Mark you, this includes all labor cost of handling the bars, placing in the machines, cutting off, removing burrs, marking and loading on the cars. In other words, \$1.00 to \$1.05 represents the actual cost from bar to car.

When cutting 6½-in. round finished shell steel the production is 550 per 22-hr. work while the same machine operating on ordinary open-hearth steel would double the output—1,100 billets.

Prompt—6½-in. rounds or less machines, one each week. 13-in. machines, one every 30 days. These machines will operate successfully 24 hours day in and day out, yet keep out of the repair shop. Send for illustrated descriptive catalog—free for the asking—no obligation incurred

Manufacturers Engraving Machines and Fine Machine Tools of all kinds. Large stock standard U.S.T. Steel Cutters always on hand.

# Gardner Grinders

Illustration shows a grinder developed especially for removing the hub or centre projection from the ends of shells. This machine is also used for cutting off the square or angular hubs from High Explosive Shell Base Plates. We build a much more powerful grinder to be used for these same operations on 6-inch shells.

## Features :

High-grade Babbitt Bearings and Lever Feed.

Rapid clamping of Shell into "V" fixture.

Pump and water system driven from countershaft directs the water or grinding compound at point of grinding contact.

Can be equipped and operated at both ends for double output.

Output, according to size of projection to be removed from 40 to 100 per hour. Equipment includes two 16" Perfection chucks, two 16" abrasive ring wheels, two semi-universal lever-feed work tables, two shell-holding fixtures, water and pump, with connections; countershaft and usual attachments. Weight, 4,500 lbs.

## Recommended After Practical Tests

Speed is demanded in all cutting operations, provided the quality of work is kept up to the highest point. When Mystic Cutting Compound is working in co-operation with the operator the tools have no chance of losing their temper or cutting-edge from overheating. Mystic keeps a strict and constant contact with the friction points and has them perfectly lubricated at all times.

It has four distinct features that will convince you of its excellent quality.

1. For machining Shrapnel Shells it has no equal.
2. Will not separate in solution, gum machines or rust.
3. It increases production and costs less.
4. It is non-combustible, and contains nothing injurious to operator's hands.

Our confidence in its quality, backed by the opinions of our users, as shown in our excellent free trial offer. Remember, you will be under no obligation. Inquire at once.

The sooner you inquire—the more you will save in production cost, and the better the results.

*We will demonstrate, free of cost, the value of Mystic Compound.*

## Cataract Refining Company, Limited

Toronto, Ontario, Canada

# ATTENTION, CANADIAN MANUFACTURERS

## An Opportunity for an Aggres- sive Concern to Secure a Protected In- dustry

The license for the **Anderson Rolled Gear** (now being manufactured in England and United States in large quantities) is open in Canada. This gear, which is generated hot in a few seconds, equals or betters the accuracy of any cut gear, has a forged tooth, which shows in test 25% more strength. Any form of tooth, including double helical, spurs or bevels, can be rolled as readily as the straight spur or bevel, and these forms of gears are far more desirable but could not be produced economically enough for commercial purposes. Practically all gears which have been manufactured to date are used in automobile rear axles, where highest accuracy is required. The market for gears is a large one, as nearly everything mechanical carries gearing.

Samples and full information to responsible concerns desiring to investigate.

# BAWDEN

# PUMPS

## ADVANTAGES

*No Tappets, No External Valve  
Gear Levers, No Springs,  
No Internal Tubes or Stuffing Glands*

The Steam end has absolutely nothing to go wrong; it will make a full stroke under any and all conditions, run at any working speed without adjustment, and has no dead centres, proved by the fact that it will run on water pressure as well as steam pressure. The water valves have the seats driven in on a special taper and held solid with brass stoppers through top cover, making it impossible for them to rattle or shake loose.

### OUR GUARANTEE:

- A—Saving in steam consumption over all standard duplex pumps.
- B—To make a full stroke of the piston under all conditions.
- C—Has no dead centres.
- D—Run at any working speed without adjustment of any kind.
- E—Not to knock or bang.
- F—Pumps to be all we guarantee, or returned at our expense.

## "Rockford" Milling Machine

Profits come quicker with use of the "Rockford" Miller. Its unusual capacity for all classes of work and the ease with which it can be operated give you a speed of production that makes a big increase in your profits.

The secret of the productive power of this No. 2 "Rockford" Universal Milling Machine is the great surplus power over all demands that may be made of the machine—it more than meets severe demands of modern milling. For tool room or shop, for manufacturing or jobbing, the "Rockford" holds first place as a profit-maker.

*This Milling Machine has many mechanical features that save dollars in time and labor, and expedite production. Let us describe these features in detail. Inquiries promptly attended to.*

*Write us.*

# STELLITE

## ANNOUNCEMENT

by

### DELORO SMELTING & REFINING CO. Limited

A year ago this Company arranged with the Patentee, Mr. Elwood Haynes, of Kokomo, Ind., for the manufacture and sale in Canada, Great Britain and Europe of his recently discovered alloy "Stellite," a remarkable high-speed tool metal that has been effective in greatly increasing the output in the factories where it has been used. This material was introduced to the Trade in Canada by the Canadian B. K. Morton Company, and the success of the new metal in Canada has been very marked.

Believing that it would be to the interest of consumers and ourselves to come in closer contact, **we are taking over the direct sale of this material at the beginning of the new year**, after which date this Company will handle all Stellite orders and enquiries.

We have engaged the services of expert demonstrators who will be at the service of our customers when required.

Stock will be carried at 200 KING ST. WEST, TORONTO, from which place deliveries can be promptly made to customers in that district, and later office and warehouse will be maintained in Montreal.

The rapid increase in the demand for this metal both in Canada and Europe has warranted the erection of an extensive plant and equipment at Deloro, and we are now in position to fill all orders promptly.

### DELORO SMELTING & REFINING CO. LIMITED

## CLEVELAND RIVETING, CHIPPING, CALKING AND BEADING HAMMERS MOST POWERFUL AND EFFICIENT AIR TOOLS ON THE MARKET

Cleveland Pocket-in-Head Riveters are made in 15 styles, with Outside and Inside Latch, and have driving capacities of  $\frac{1}{4}$ -in. to  $1\frac{1}{2}$ -in. rivets in Boilers, Tanks, Stacks, etc.

They have an enviable record for durability and economy in service.

### CLEVELAND CHIPPING HAMMERS

are made in 19 styles and sizes to suit all classes of work. They are ideal tools for foundries, as they have high speed, no recoil, and are practically dust-proof.

In stock: Riveting and Chipping Hammers, Air Drills, Corner Drills, Sand Hammers, Portable Grinders, Bowes Couplings, Chisels, River Sets, etc.

### PORTABLE ELECTRIC DRILLS

Model "B" Drill illustrated, shows compactness of design. The Casing, Switch and Gear Covers are aluminum; the breast plate, motor-head and handle supports are of steel. The machine is light in weight, convenient in shape; has high speed; operates on either A.C. or D.C. currents and runs either forward or reverse as desired. Model "C" has two speeds and in construction is similar to Model B.

Bulletins mailed on request.

From Cutters and Tools kept Sharp on

### GARVIN No. 3 UNIVERSAL CUTTER AND SURFACE GRINDERS

Simple      Light Running      Accurate

The spindle is hardened and ground and supported out close to the wheel by an extended bearing, and carefully protected from emery.

The knee and the yoke carried on the knee both have a large range of adjustment. On the knee yoke or carriage is mounted the swivelling table, which has a quick, sensitive movement by rack and pinion operated from end or side.

On this table is mounted the index head, and all the attachments are held in this head.

An outfit of emery wheels, mandrels, bushings, wrenches, etc., is supplied with the machine.

Machine is designed to keep its original factory accuracy.

CAPACITY: CUTTERS, 14 in. x 6 in.; SURFACES, 9½ in. x 6 in.

# SPEED

## In the Heavy Turning

# The Connecticut

## High-Duty Lathe

A "Single Purpose" lathe built to turn or bore high carbon steel forgings to the limit of the cutting tools.

It is rigid and accurate under all conditions, easy to operate and a fast worker.

It is efficient in the extreme and has demonstrated its superior service in prolonged tests of great severity in many shops. It is in all respects heavier and more rigid than standard 30-inch and even 36-inch lathes giving the same distance between centres.

The Usual Cutting Speeds on Shell Work are 40 to 50 feet per minute on shells up to 8 inch diameter, 30 feet per minute on larger sizes. Depth of cut from  $\frac{1}{4}$  inch to  $\frac{5}{8}$  inch depending upon the eccentricity of the piece. Our lathes will stand more than this.

We admit the big gear is not particularly handsome, but it eliminates the train of small gears, and adds greatly to the strength and wearing qualities.

Let us tell you all about it. Write for bulletin giving full details.

**JANUARY DELIVERY**

# Big Shells — Too —

*This Hydraulic Banding Machine is Built in sizes to take Shells up to 15½ inches diameter.*

Machine consists of a series of hydraulic rams set around inside a weldless rolled steel ring, mounted on a cast-iron base, and operated by a hand-driven pump. An advantage peculiar to this machine is the special equipment which prevents the edges of the bands from becoming sheared during the banding operation.

For compressing bands on shrapnel and high explosive shells there is no more efficient machine built. It is **RAPID, RELIABLE** in **OPERATION** and turns out work in strict accordance with Government requirements.

These banding presses are **adaptable to a variety of other work** and will make profitable permanent equipment after shell contracts are completed.

Write us your requirements and let us submit prices. Please specify size of shells and dimensions of bands.

# WHO'S WHO IN THE SAND BLAST LINE AND WHY

"PANGBORN" Exhibit at the 1915 Foundrymen's Convention, Atlantic City, September 25th to October 1st. The largest and most complete/operating exhibit of Sand-Blast and Allied Equipment ever made in the world.

**T**HE Exhibit filled 4 large freight cars and required 2000 sq. ft. floor space (considerably more than was occupied by all the other Sand-Blast exhibitors put together) and conclusively demonstrated the completeness of the "PANGBORN" line of Sand-Blast and Allied Equipment. The smooth and shop-like operation was evidence of "PANGBORN" capacity and facilities for doing the out-of-the-ordinary speedily, and under the most adverse conditions. It, indeed, was no simple matter. The equipment was put through the Shops on short notice without serious interference with a large volume of regular business, and the erecting of the equipment on the pier at Atlantic City was completed in less than 5 days. Examination of the Exhibit revealed the striking features of "PANGBORN" products, viz.: Safety of Operation, Compactness, First Class Materials and Workmanship. The operation of the Equipment proved that "PANGBORN" Equipment has maximum efficiency and makes the best investment.

The Equipment exhibited consisted of the following:

- |                                |                                    |
|--------------------------------|------------------------------------|
| "L" Room Sand-Blast            | "HA" Baffle Moisture-Oil Separator |
| "AF" Hose Sand-Blast           | "AC" Pressure Hose Sand-Blast      |
| "BG" Screen Sand-Separator     | "GC" Pressure Barrel Sand-Blast    |
| "IB" Belt-Bucket Elevator      | "DC" Modern Stove Sand-Dryer       |
| "FC" Grated Top Room Truck     | "AG" Pressure Twin Hose Sand-Blast |
| "D" Dustless Operator's Helmet | "EA" Suction Cabinet Sand-Blast    |
| "LA" Rotary Table Sand-Blast   | "KD" Coned Wheel Dust Exhauster    |
| "GB" Suction Barrel Sand Blast | "CC" Screen Dust Arrester          |

The Exhibit, of course, did not include the whole "PANGBORN" line. There are other designs of the types of equipment exhibited, and additional types and sizes that were not exhibited at all. The complete line of "PANGBORN" Equipment covers practically every requirement, and special equipments are designed and made to order.

"PANGBORN" Sand Blast and Allied Equipment  
is making and saving money  
in hundreds of the best foundries throughout the country  
It will do the same for you

## Oxy-Acetylene Welding and Cutting

The above shows the Prest-O-Lite Process as used for making an "on the spot" repair in shops of P. F. Collier & Co., New York City, publishers of "Collier's Weekly."

## Welding Makes Possible Marked Economies in Your Plant

By avoiding costly delays and saving expensive replacements, single repairs by welding have often times more than paid the cost of complete welding equipment in hundreds of shops and factories.

Fortify your plant against losses incurred by sudden breakdowns. The many highly profitable uses to be found both inside and outside your shop for oxy-acetylene welding will amaze you.

More important perhaps than effecting emergency repairs to important tools or equipment is the usefulness of this process in simplifying many manufacturing operations and cutting production costs.

In many instances it is entirely displacing the rivet and bolt, because welded joints, in nearly all cases, are better, stronger and neater than those of other methods of metal-joining.

Find out about these possible economies for your plant.

## *Prest-O-Lite* PROCESS

Employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene (ready-made carbide gas) is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work, and lower cost, and also avoids the large initial outlay and heavy depreciation incurred in making crude acetylene in a carbide generator.

Necessary equipment is not expensive. We furnish high-grade welding apparatus for \$75.00; acetylene service at additional cost. Adaptable for oxy-acetylene cutting by the addition of special cutting blow-pipe. Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene—any average workman who understands metals can learn the process quickly and easily.

We'll be glad to give you full information on the Prest-O-Lite Oxy-Acetylene Process of welding and cutting. Tell us about the particular work you are contemplating.

## 16 in. Lever POST DRILL

**A Giant Little Machine  
For Light Drilling.**

**Will drill up to 7/8 inch.**

The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle.

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

Drills to centre of 16-inch circle.

Run of feed 5 1/4 inches.

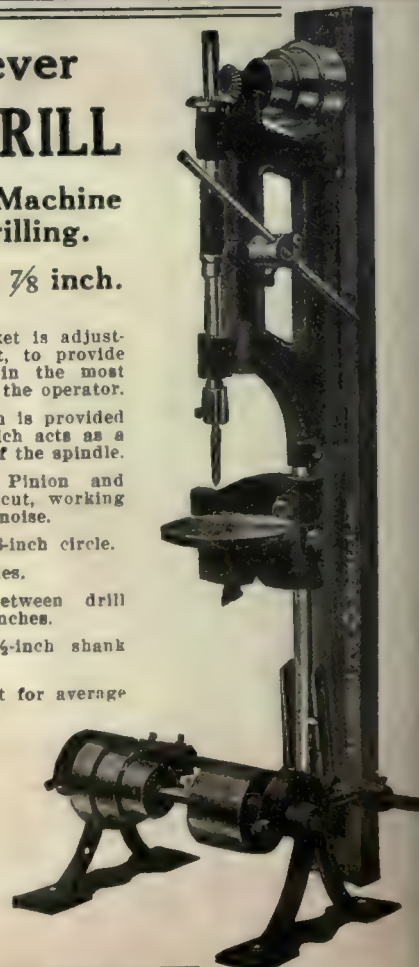

Greatest distance between drill spindle and table, 22 inches.

Spindle bored for 1/2-inch shank twist drills.

Speed of countershaft for average work, 300 per minute.

# AIR CHUCKS FOR SHELL MAKERS

**Increase your production 25% by installing Hannifin Air-operating Mandrels and Special Projectile Collet Chucks.**

**S**EVERAL years ago the railroads adopted the Air brake because of its increased efficiency over the hand-brake. We all know the Air brake has come to stay.

Progressive manufacturers throughout Canada and the United States have seen the advantages of Air Equipment in their machine shops as a method of increasing production and decreasing cost. Ask the man who has used one, and then see us.

We have a thoroughly equipped plant devoted exclusively to the manufacture of Air Equipments.

Our experience extends over a period of eight years.

Mail blue prints for estimates.

Machine above is performing second boring operation on shells.

**J. R. Stone Tool & Supply Co.**  
DETROIT, MICH.

Out shows Chuck on nosing operation. This is one of over two hundred in this Canadian plant.

*This chuck is built on the duplicate part system. It is simple, effective and fool-proof.*

It grips the shell in a predetermined position. The jaws will not slip on the shell. It has shell interior and exterior adjustable stops.

A trial on one of your lathes will convince you that this is THE Chuck for shell work.

## A Big Efficiency Unit in Your Shell Plant

### A. J. LAVOIE'S LOW PRESSURE

## Compressed Air Chuck

This chuck can be applied to any make of lathe, without alteration to the machine, and will increase production from 25% to 75%. It grips and releases the shell while in motion—no need to stop your machine.

It is a single unit combination attached to the face plate of lathe, supported by an additional heavy duty bearing, thus making a heavy duty lathe out of a light machine. A small lever operates the chuck. Will operate with a pressure of 60 lbs. per sq. in.

MANUFACTURED BY

**The Montreal General Tool Co.**  
673-5 Notre Dame Street, Maisonneuve, Montreal, P.Q.

Also manufacturers of shell tools, and special machine attachments of all kinds made to order.

*Mention this paper when writing advertisers. It will identify the proposition about which you require information.*

## "THE CRITICAL MOMENT"

All the dramatic intensity of the original scene—with all its rich coloring—has been caught and held in the "Cleveland" wall calendar for 1917.

It is a fit successor to our "Robert Fulton" calendar of 1916 and we anticipate an even greater demand for it.

***Wouldn't You Like a Copy  
For Your Shop or Office?***

We will be glad to send it, but that prompt delivery may be assured, we would suggest that you write on your letterhead or—better yet—use the attached reservation blank.

## LYMAN Service from Stock

In these strenuous days of short supplies and rush demands, we are daily demonstrating to our customers what SERVICE means.

From our Warehouses in Montreal and Toronto we are prepared to make **IMMEDIATE SHIPMENTS** of:

**Shelby Seamless Steel Tubing**  
in over 350 sizes, round and square.

**Steel Balls**

**Journal and Thrust Bearings**

**Driving Chains of all types**

**Chain Hoists and Trolleys**

**Rawhide Gear Blanks in all sizes**

**Lock Nuts**

**Speed and Revolution  
Counters**

**Sash and Trolley Cord**

**Railway Lanterns**

**Carbon Brushes**

**Graphite Bronze Bushings**

**Garton-Daniels Lightning  
Arresters**

**Also Steam and Electric  
Railway Supplies**

## LYMAN Personal Buying Service in New York City

Supplementing our "Service from Stock," we have opened for our customers' accommodation a special purchasing office at 2606 Equitable Bldg., New York City, under the management of Mr. K. E. Gury. Our experience and connection enable us to locate and ship at once supplies which our Canadian customers have been unable to secure elsewhere. Here is a typical instance:

Just the other day one of our largest Street Railway customers came to us in almost desperate need of a certain line of Steel Wire. None seemed available—yet through our New York Office we found, purchased and shipped the wire to them the very same day.

Remember, this service is for **YOUR** accommodation. We are prepared to purchase for you, from stocks in New York, all classes of Tubes, Metals and Mechanical Equipment, also Steam and Electric Railway Supplies.

# TO SHELL MAKERS

## We Specialize on:

- (a) Our Patented Nosing Die (4.5"-5" and 6").
- (b) Thread and Seating Gauges (all sizes).
- (c) Milling Hobs for Milling Nose of all sizes of shells.
- (d) Thread and Seating Attachment for Lathes. (Patent Applied for).
- (e) Band Turning Tools for 4.5" and 6" shells, Price \$25.

- (a) If you are changing Nosing Dies every five or ten thousand shells, you are wasting valuable time and money. Try our patented die, and so make your nosing operation continuous.
- (b) We guarantee that if our Thread and Seating Gauge passes your shells, that the Government Gauges will also pass them; otherwise we take them back without hesitation. The life of our Gauge is longer than all others. Price \$50.
- (c) Our Milling Hobs are made by experts, and we specialize on this class of work for all sizes of shells. Price \$15.
- (d) Which would you rather use?

1 Thread Milling Machine  
and  
4 Hand Seating Tools  
requiring  
5 men for each Shift  
turning out  
150 Shells per Shift at a cost of \$18.00

|  
OR  
|

1-16" Lathe  
and  
1 Thread and Seating Attachment (Patent Applied For)  
requiring  
1 man for each Shift  
turning out  
150 Shells per Shift at a cost of \$4.00

*The cost of this attachment is only \$120.00, and your engine lathe will be of use after the war work is over.*

# "Hamilton" 48" x 48" Planer

**NEW  
HEAVY  
PATTERN**

A heavy duty machine, capable of handling work with precision and dispatch. Its extremely liberal dimensions, excellent proportions, great convenience in operations and careful construction assure both quantity and quality of output, and the machine is high-class in all respects. Sizes from 24" x 24" to 54" x 54".

## For Twenty-Five Years Manufacturers of Fine Machine Tools

The war didn't start the manufacture of Hamilton Machine tools—there has been no hurry-up idea behind their construction, but years and years of experience and careful study.

Hamilton Tools have won distinction for their accuracy, production and durability. As an investment you will consider them without equal.

WRITE FOR FULL DETAILS.

**THE HAMILTON MACHINE TOOL COMPANY**  
HAMILTON, OHIO, U.S.A.

## New "Hamilton" 20" Cone Head Lathe

A modern, substantial lathe of accurate construction, capable of turning out work rapidly and with precision.

Has Double Back Gears, Three-Step Cone, Quick-Change Feed Box. Full details in our catalog. May we send it?

A lathe that meets and triumphs over modern conditions. Sizes 14 to 24 inch.

"HAMILTON" 20" x 8" Cone Head Style "B" Lathe, Double Back Geared.

If any advertisement interests you, tear it out now and place with letters to be answered.

# The Lathe Speeds Production

*—in practically  
every line of  
manufacture—  
yours included!*

"We must put through more of our product!" Time after time manufacturers reach that point. It seems imperative to speed production—but quality has to be maintained—and it becomes a matter of selecting *better* tools with which to handle each operation. A good man takes up no more space than a poor one. The same is true of a good lathe. The "Sidney" lathe makes valuable floor space still more valuable. Will it do better work? Has it made good in Canada under severe conditions? Can we secure prompt delivery?

*Just a few of the many questions which we can  
answer to your entire satisfaction if you will  
write the home office or to a Canadian agent.*

Check off these points and then write for complete bulletin on the "Sidney" lathe:

20% steel mixture  
in bed casing.

50-point carbon steel headstock spindle offset  
1" off centres for heavy duty work.

Heavy carriage  
vee 2½" wide.

For **HEAVY TURNING** the particular type illustrated above will give excellent service.

## The Sidney Tool Co.

Sidney, Ohio, U.S.A.

Canadian Agents:

ONTARIO: A. R. Williams Machinery Company  
TORONTO: Foss & Hill Machinery Company

### REMEMBER

and write for the "Sidney" Lathe Bulletin and carefully consider this machine as a means of increasing efficiency.

"Little David"  
Grinder

"Little David"  
Drill

Air Hoist

## High Grade Tools

*Maximum Power  
Minimum Cost*

Realizing that maximum power and minimum cost are dependent on one another for the solution of that great problem, cost-reduction, we have the Ingersoll-Rand Air Compressors and "Little David" tools perfect in operation and as simple as possible in construction. We do not mean the first cost, but rather upkeep cost.

In Air Compressors, the Ingersoll-Rand products bear the stamp of quality that singles them out distinctive from all other makes. For small plants we build compressors from 10 to 100 lbs., with short belt-drive attachment.

The "Little David" tools are air driven. Two of their line are shown to the left. The Grinder is admirable for grinding out the bore and afterwards buffing same on large shells. The Drill will perform all ordinary drilling or reaming operations.

The Air Hoist is featured by air being under pressure on both sides of the piston. This fact, together with its simplicity, makes it indispensable in the all-round efficiency of your plant.

Inquire at any of our offices.

# STEEL CASTINGS

This is a sample cut from a Dominion Steel Casting machined and bent cold. It illustrates the superiority of Dominion Cast Steel for machinery parts.

## Representative Physical Test.

Tensile Strength	74200
Elastic Limit	38400
Elongation in 2"	31.2 %
Reduction in Area	51.5%

The greater strength and durability and freedom from blow-holes of Dominion Steel Castings protect you against complaints and lost sales that are the result of broken iron parts.

These castings are the product of our *Acid Open-hearth Furnace*, and are made from a special steel mixture. All heats are subjected to chemical and physical tests.

They cost slightly more than grey iron castings—but remember, the better your castings, the better your product—and the better your business.

ALBANY, NEW YORK, U.S.A.

*THE LARGEST MACHINE WAREHOUSE IN AMERICA*

Warehouse,  
981-989 Broadway,  
Albany, N.Y., U.S.A.

Branch Office,  
Room 1001 Singer Bldg.,  
New York, N.Y., U.S.A.

We always carry in stock and for prompt delivery **New and Rebuilt Machine Tools** of all kinds.

We positively guarantee each and every used machine to be in first-class working order, having been thoroughly overhauled, rebuilt and tested out before being offered for sale. We are, therefore, in position to make the above guarantee.

We respectfully request all inquiries for all classes of machine tools.

If you are interested in receiving our weekly bulletin of new and rebuilt machines available for immediately delivery, we shall be pleased to hear from you.

We are also manufacturers of the Simmons No. 6 Standard Universal Tool and Cutter Grinder. Machines available for immediate delivery. Circulars on request.

A grinder with massive table, micrometer adjustments, very long knee and gibs, and extra heavy head and tailstock—it will pay you to investigate.

In addition, you'll find that the headstock is fitted with large bearing for chuck spindle and with special bronze bearings of navy specifications, spindle is tapered and bored to take wheel arbors, and bearings are 1 in. in dia. and 2¾ in. long, and an exceptionally simple and sturdy countershaft with self-lubricating bearings.

## Motor Driven Speed Lathe

This style of motor drive employs a constant speed motor mounted on a plate having an extension arm to support a bearing for the outer end of the motor shaft. The motor plate is fitted to a slide on a shelf which is securely fastened to the back of the lathe bed. The motor plate is moved by means of a screw which tightens or loosens the belt. A four-step cone pulley on the motor shaft is belted to a four-step cone pulley on the spindle. This gives the same speed variation as when a countershaft is used, and by means of various size cones on the motor a wide range of speeds are obtainable.

The lathe spindle is made from high carbon steel, ground to size, and running in self-oiling bronze bearings. The tailstock has screw and lever feed. The bed is cross-braced and all clamping levers are above the ways.

**J. G. BLOUNT CO. - Everett, Mass., U.S.A.**

## Determine, Measure and Eliminate LOST TIME and MOTION

Master Cronograph

The day of advanced prices only for the purpose of advanced profits has now passed.

To "economize" on selling expense may be "to save yourself into bankruptcy."

The one opportunity for the manufacturer to increase his profits is by a reduction of costs.

Labor in America will never sell itself cheaper than to-day, and the cost of materials is increasing yearly.

Therefore, increased profits in your plant are dependent upon just one thing:

**You must determine, measure and eliminate lost time and motion.**

The Master Cronograph will enable you to determine without further calculation just what a man or a machine

DOES DO and SHOULD DO in an hour or a minute.

With such information, you may STANDARDIZE the operation—INSTRUCT your men to a more profitable effort and MEASURE their work in terms of the new standard—thus extracting from your present conditions an added profit without the expenditure of an extra dollar.

The Master Cronograph is the one device which will show at a single rating the total of its computation. The only stop watch that will reduce net time to output or production per hour without the use of a pencil. It embodies a 17-jewel time-piece. Write for literature.

# TURNER? TURRET

If it is a question of drilling, reaming, threading, undercutting, facing, underboring, etc., the Turner Turret will accomplish these at a great saving. One reason for the saving is that 4, 5 and 6 operations may be completed without resetting tools. Good reason, isn't it? But that isn't the only reason.

Trunnion Chucks make working on several sides possible with one chucking

Turret is suspended within rigid, accurate case. Detent located in case and fits adjustable socket in turret.

# Hollow Spindle Shell Lathe

for boring and turning shells from  
9.2 down

## ABOVE CUT SHOWS ATTACHMENTS AVAILABLE

1. Bed has Chilled Ways. These are deep and wide, and braced by wide cross ribs. Permanent maintenance of alignment. Bearings are dowed into position.
2. Can be furnished with centre rack if desired. Furnished also with boring bar with removable cutters, as shown.
3. We furnish this lathe also with Hydraulic Cylinder giving quick return and positive drive.

## Among other good features, note the following:-

3" belt on feed.  
7" belt and 75 H.P. friction.  
18" turret.  
Keys for boring bars.  
External feed friction.  
Four-pitch rack.

Note Sheet Steel Oil Pan.  
No countershaft required.  
Bronze Bearings throughout.  
Hardened and ground thrust collars.  
An overplus of strength throughout.  
Workmanship and material guaranteed.

Hollow Spindle entirely developing shell. Two speeds to drive.

THIS LATHE WILL GIVE YOU SATISFACTION. IT IS FURNISHED COMPLETE WITH AIR CHUCK AND BORING BARS IF REQUIRED.

*Immediate Shipment from Stock (Subject to Prior Sale)*

**The FOUNDRY & MACHINE CO. LIMITED**  
1167 CARRIER ROAD MONTREAL, CANADA

Showing the close grain of the metal used in making these lathes.

# RUDEL-BELNAP

## Machinery Co. Limited

### Shell Machinery Specialists

We SUPPLY all kinds of TOOLS and MACHINERY for the manufacture of shells, forgings and their component parts.

We EQUIP complete plants.

We GIVE service.

We GIVE the most valuable practical experience in machine shop practice.

We can SUPPLY your requirements promptly.

# The Schoop Process

OF BUILDING UP LIGHT-WEIGHT SHELLS. ONLY ONE OF ITS NUMEROUS USES

*Montreal Gazette*  
Dec. 13th, 1916.

## CANADA HAS FAILED IN HER PROMISE TO BRITAIN ON SUPPLY

**Mr. J. W. Flavelle Says Delivery  
of Munitions Must be  
Speeded Up**

**SHELLS** shown on this page were 4.5 Howitzer, which WERE SHORT WEIGHT. They were copper-coated by the Schoop method and after having been fired, at the proving grounds at Quebec, the copper remained intact.

Canada will not fail in her promise, as all short weight shells can be re-claimed by this method.

Simple—Efficient—Cheap

LET US HELP WIN THE WAR.

Building up short-weight shells by our process.

*Write for Booklet*

MADE IN  
WINNIPEG

LET US DEVELOP YOUR PATENT IDEAS

## W-G Noiseless Rawhide Cut Gears

*The only exclusive gear-cutting plant in the West.*

The latest machinery and the most skilled mechanics assure a product of top-notch quality.

We give quick service and reasonable price.

RAWHIDE, STEEL, BRASS  
CAST IRON  
SPUR, BEVEL, MITRE

## Winnipeg Gear & Engineering Company

ENGINEERS, DESIGNERS, BUILDERS OF SPECIAL MACHINERY  
197-199 Princess St. - WINNIPEG, MAN., CANADA

## U. S. Electric Drills and Grinders

Save Time, Labor and Money

They can be attached to any lamp socket.

For drilling in metal they are superior to any other kind of portable drill. Cost 50% less to run than air drills.

3 SIZES  
3-16 inch, W.G.T. 6 lbs.  
3/4 inch, W.G.T. 9 lbs.  
1/2 inch, W.G.T. 12 lbs.

All motors wound for 110 or 220 volts.

Direct or alternating current.

Try a few of our Electric Drills and Grinders and you'll send us an order for more. Our guarantee protects you.

For Sale By  
The Canadian Fairbanks-Morse Co., Limited

Montreal, St. John, N.B., Toronto, Winnipeg, Calgary, Vancouver.

THE UNITED STATES ELECTRICAL TOOL CO.  
CINCINNATI, OHIO

1/2 inch—2 SPEED.  
Speed, 400-700 R.P.M.

You can drive high speed drills  
up to 2 1/2" diameter

with the new box-column type

## Heavy Duty "Rockford" Drilling Machine

This Rockford machine tool meets the most exacting requirements.

It is **STRONG, RIGID, ACCURATE AND FAST**, with individual features. Built in three styles.

## More Production — Greater Accuracy — Less Globe Breakage — Happier Men

That sums up the argument on this lamp bracket. Three frictional universal joints that can't wear out and are adjustable for any desired tension give the reason.

**Just a slight push or pull puts the light where you want it, when you want it.**

Any workman will do more and better work if his light is always in just the right place and under instant control.

### The Searchlight Bracket

will pay for itself many times over in one season. The period of short days is approaching. Many shops are working night and day the whole year through. The cost is trifling compared with results. Only \$1.50 each, with big discount, according to quantity.

Write now for samples and let us show you how your whole factory could be equipped at a big saving to you. Any quantity sent on 30 days' trial to any responsible concern. You can't possibly lose, and **You Might Win!**

### The McCrosky Reamer Company

Meadville, Pa., U.S.A.

Export Agent:

Benjamin Whittaker, 21 State St., New York

## Roper Oil Pump

To the progressive foreman or manager who is ever on the alert to get away from the "good enough" stage and enter into the "best" class this pump has a direct appeal. This is a one-way pump, giving a free, steady flow that is absolutely free from that undesirable pulsating flow so common.

We also make reversing pumps for machines where tools operate with the spindle running in both directions.

## C. F. Roper & Co.

Hopedale - Mass. - U.S.A.

H & G

## Your Threads

Will they stand improvement? If they will and you want the best results—H. & G. Automatic Self-Opening Die Heads will do the trick.

The chasers are set and held in place by a steel cam, which, once adjusted, locks: there is no stoppage or changing in size. The quick release not only insures the cutting of the thread to a given point every time, but permits cutting right up to a shoulder when necessary.

Write for our booklet!

## Better Threads

—because there is no possibility of a thread being roughed or torn through a tap clogging with chips when backing off.

## Lower Costs

—because fully half the time on threading operations is saved by instantly backing off the tap the instant the cut is completed.

ILLUSTRATION SHOWS  
"VICTOR"  
2 inch  
Collapsing Tap  
Operating on nose  
of  
9.2 - inch  
H.E. Shells  
—V—

These taps are strong and durable and are made from the best materials obtainable. The bodies are machine steel, and the chasers best grade high-speed steel. Simple in construction, and taps are easy to set; screw adjustment from the front end maintains close accuracy; automatic trip reset by lever; adjustment at rear end regulates spring tension. Sizes 1 to 12 inches, any pitches. By adjustment they can be made to cut standard, large or small threads.

*The very tool you need for that hard shell work. Used by many of the large shell manufacturers.*

Send blue prints for estimates on Victor Equipment.

## Rivet Speed

One every second is a speed which this Grant Rivet machine will keep up indefinitely, in any degree of tightness or looseness desired. Each rivet is finished with perfectly shaped head, polished and with no hammer marks showing.

We claim this is the only machine manufactured that will accomplish this feat. Our claims are unchallenged. By writing for our catalogues you may obtain full information regarding the ability of this machine.

We are rivet machine specialists. Get in touch with us

## Grant Man'fg. & Machine Company

## Grinding Wheel Dressers

Canadian  
Desmond-  
Stephan  
Manufacturing Co.  
Hamilton,  
Canada

## That Coated Wheel Problem

You know how a coating, no matter how slight, spoils the cutting efficiency of your grinder? If you are equipped with a Desmond-Stephan Dresser, the cutting surface can be renewed; your efficiency consequently increased, and wheel troubles will disappear.

For the ordinary shop grinder, specify "Diamo-Carbo." For large, coarse, and hard wheels, specify Huntington No. 2.

Alfred Herbert, Limited, Coventry, Agent for Great Britain

# CHICAGO RAWHIDE PINIONS

THE PRODUCT OF OVER 30 YEARS EXPERIENCE

CHICAGO RAWHIDE MANUFACTURING COMPANY, 1301 ELSTON AVE., CHICAGO, ILL.

## "Chicago Rawhide" Products

*Standard  
the World  
over*

The best grade of hides obtainable is used in "Chicago Rawhide" Gears — one reason why they are superior to all others.

Thirty years of experience and careful study have made "Chicago Rawhide" Gears the most dependable.

—this 112-PAGE CATALOG fully describes the product of our 37 manufacturing departments.

AN AID IN BUYING. It has been our aim in compiling this catalog to describe clearly our complete line of mechanical leather goods.

We will be pleased to mail you a copy for your files.

FILL IN COUPON AND MAIL IT NOW.

Catalog will be sent immediately without any obligation on your part.

# Wickes Heavy Duty Engine Lathe

The Wickes 26" Heavy Duty Lathe.

Built in lengths from 8 ft. up. Has 3-step cone, is double back-geared and has double plate apron.

This tool is built for the most severe service; all parts liberal in size; has special ball thrust bearings; steel apron gears; coarse pitch and wide face gears, which are all well guarded.

Let us tell you about this lathe and our 20", 32", also our 17" Rapid Production Lathe for Automobile and other work.

We can make prompt shipment.

**WICKES BROTHERS**

**Saginaw, Michigan**

## Stow Tool Post Grinder

Does the most accurate of work—patent bearings, for Internal and Surface Grinding—A.C. or D.C. Immediate shipment from stock. Plain or with slide.

One of the many electric portable tools built by

**Stow Manufacturing Co.**

Binghamton, N.Y.

Oldest portable tool manufacturers in America.

London Stock, 85 Queen Victoria St.

## Speed

Speed and ease of operation is a very difficult combination to obtain. Once you see a Racine Metal Cutting Machine in operation this fact impresses you. Ease of operation means less repair. More speed means greater output. See the advantage of the two? Imagine one in your plant—then write us for particulars.

**Racine Tool  
& Machine Co**  
15 Melbourne Ave.  
RACINE, WIS., U.S.A.
